Typographical Conventions

The following conventions are used in this manual.

| Typeface or Symbol | Meaning |
|--------------------|---|
| Bold | Book titles, important items, or items that can be selected including buttons and menu choices. For example: Click the Next button to continue |
| Italic | A name of a user defined textual element. For example: Username : <i>admin</i> |
| Courier New | Files and directories; file extensions, computer output. For example: Edit the config.xml file |
| Courier Bold | Commands, screen messages requiring user action. For example: Username : <i>admin</i> |
| > | Menu choices. For example: Select File > Open. This means select the File menu, then select the Open command from it. |
| <> | Generic terms. For example: <squore_home> refers to the Squore installation directory.</squore_home> |

<u>Notes</u>

Screenshots displayed in this manual may differ slightly from the ones in the actual product.

1. Introduction

1.1. Foreword

This document was released by Squoring Technologies.

It is part of the user documentation of the Squore software product edited and distributed by Squoring Technologies.

1.2. About This Document

This document is the Getting Started Guide for Squore.

It is indented as a follow up to the Squore Installation and Administration Guide and will help you understand how to use the Squore user interface to create and update projects. It is divided into several chapters, as detailed below:

- -> Chapter 2, The Tools at Your Disposal provides details on where to find the sample Squore projects.
- → Chapter 3, Accessing Squore will guide you through your first access to Squore as a user.
- → Chapter 4, Creating Projects and Versions covers ways of creating new projects and versions.
- Chapter 5, Understanding Analysis Results describes the user interface and functionality you will use in Squore on a daily basis.
- Chapter 6, Managing Your To-Do List With Squore helps you integrate action items suggested by Squore into your workflow.
- → Chapter 7, Going Beyond Source Code shows how you can work with artefacts that are not source code.
- → Chapter 8, Track Your Favourite Indicators shows how you can track your favourite items and consult Squore results on mobile devices.
- Chapter 9, Focus on Your Milestones guides you through the introduction and management of milestones and objectives in Squore.
- → Chapter 10, Communicating With Squore covers all reporting features of Squore.
- → Chapter 11, *Keep it Tidy: Project Maintenance in Squore* helps you maintain a Squore installation.
- Chapter 12, Repository Connectors and Chapter 13, Data Providers detail the various Repository Connectors and Data Providers you can use when launching analyses.

If you are already familiar with Squore, you can navigate this manual by looking for what has changed since the previous version. New functionality is tagged with **(new in 18.0)** throughout this manual. A summary of the new features described in this manual is available in the entry ***** What's New in Squore 18.0?** of this manual's Index.

For information on how to use and configure Squore, the full suite of manuals includes:

- Squore Installation Checklist
- → Squore Installation and Administration Guide
- → Squore Getting Started Guide
- → Squore Command Line Interface
- → Squore Configuration Guide
- → Squore Eclipse Plugin Guide
- → Squore Reference Manual

1.3. Contacting Squoring Technologies Product Support

If the information provided in this manual is erroneous or inaccurate, or if you encounter problems during your installation, contact Squoring Technologies Product Support: https://support.squoring.com/

You will need a valid Squore customer account to submit a support request. You can create an account on the support website if you do not have one already.

For any communication:

support@squoring.com

Squoring Technologies Product Support

1.4. Responsabilities

Approval of this version of the document and any further updates are the responsibility of Squoring Technologies.

1.5. Getting the Latest Version of this Manual

The version of this manual included in your Squore installation may have been updated. If you would like to check for updated user guides, consult the Squoring Technologies documentation site to consult or download the latest Squore manuals at https://support.squoring.com/documentation/18.0.18. Manuals are constantly updated and published as soon as they are available.

2. The Tools at Your Disposal

2.1. Default Users and Sample Projects

Squore ships with a collection of sample projects that we will refer to throughout this guide. Each project consists of one or several versions of the source code of an application. The code can be found in Squore Server and Squore CLI in the folder **<SQUORE_HOME>/samples**. If you do not have access to the sample projects, contact your Squore administrator to obtain a copy of the code.

Squore ships with a database that contains two sample users that you can use to familiarise yourself with all the functionality available:

- → admin/admin is the default user that can manage the server installation, reload the server configuration after changes and perform access management tasks for the Squore installation.
- demo/demo is the default Squore power user that can create, review and manage projects, as well as give team members visibility or management privileges on the projects he himself manages.

You can use these two default users, but we recommend that you change their passwords after your first connection. The privileges and permissions assigned to these default users can be modified as needed. You can familiarise yourself with Squore permissions and privileges by referring to Section 3.1, "Understanding Profiles and Roles".

You may choose to read this manual from beginning to end, or jump straight to a specific topic. Logging in as the **demo** user, gives you access to a **Tools** menu that allows to reproduce the examples shown in this manual. Click **Tools > Build Demo Projects** and select the **Software Analytics - C samples** to get started.

|---------------------|--|--|
| Build demo projects | Build demo projects | |
| | Demo: Software Analytics - C samples 🗸 | |
| | Execute | |

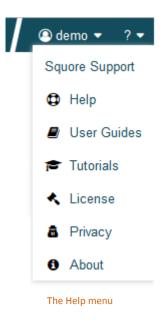

The Tools menu allows you to create sample projects using the Software Analytics - C samples option

Тір

The menu is only accessible to the user **demo** or any user who belongs to a group called **demo**. Contact your Squore administrator if you do not have access to the Tools to create the sample projects.

2.2. Getting More Help

If at any moment you have doubts about how a feature works, Squore offers help in HTML and PDF formats. A Wiki and support site are also available.

2.2.1. Online Help

The Squore online help can be accessed from anywhere in Squore by clicking on the **? > Help** menu entry.

The online help is contextual and provides information in a popup window about the page that you are currently viewing in Squore.

2.2.2. User Guides and Support Wiki

The Squore user guides are available in PDF and HTML format by clicking the **? > User Guides** menu entry in Squore. You can download a copy for offline use.

The Squoring Technologies Support Wiki provides release notes, known issues and hints and tips for current and past Squore versions. Visit http://openwiki.squoring.com for more information.

2.2.3. Review Log Files and Download Debug Data

Every **owner** or **Project Manager** of a project can retrieve the analysis log files for their projects without the need to consult an administrator. This is done by accessing the **Manage** page for a particular project and viewing the **Versions** tab (**Projects page > Manage icon > Versions tab**) as shown below:

4

The Versions tab provides access to log files and allows to Download Debug Data

Clicking the **Log** icon opens a page showing the project's client and server logs for that analysis, as well as configuration and output files will open in a new browser tab.

Clicking the one of the **Download Debug Data** links above the versions table downloads a zip file of the logs and project data that can be further analysed to understand problems during an analysis. The lower levels include only data related to the latest analysis, while the higher levels include information related to the history of the entire project.

A debug data zip file contains a collection of logs, temporary and output files for each one or more versions of the project. Each version folder can contains the following items:

- A DataProviders folder containing the output files generated by each Data Provider run during the analysis.
- → A [DataProviderName].log file for each Data Provider included in the analysis.
- A [projectId]_conf.xml file summarising the project parameters used for the analysis.
- A [projectId]_output.xml file containing the output information requested with the --filter parameter during the analysis.
- A build.log file containing the information relative to actions carried out on the server during the analysis.
- A build_client.log file containing the information relative to actions carried out on the client during the analysis.
- A excluded.log file containing the list of all files not included in the analysis and the reason for their exclusion. Note that this file is only generated if some files were excluded.
- → Atable.md5 file containing state information about the analysed source code, if any.
- [>] A storage folder containing information about the analysed source code, if any.

Ref : SUM_Squore

Тір

If you do not want to download the entire debug package, note that the main log files can also be downloaded individually from the Projects page by clicking on the project status label.

In order to investigate application failures (rather than project analysis errors), Squore administrators have the possibility to extract the latest log file created by the application. You can access the log if you have administrator privileges by clicking **Administration > Server Log** in the toolbar after logging in. The log file opens in a new browser window or tab.

Administrators can also get debug information and manage any project created on the server by clicking **Administration > Projects**, which provides a detailed view of all projects created on Squore Server, on a summary page shown below.

3. Accessing Squore

This chapter walks you through your first access to Squore and covers the web interface and some ways to customise it to your liking.

3.1. Understanding Profiles and Roles

Before you start working with Squore, it is essential to understand how access management works. The various permissions and privileges that can be assigned to Squore users are grouped in profiles and roles respectively. A set of default roles and profiles is available when you first start the server. You can edit them, or create more as needed.

Use this simple trick to remember the different between a profile and a role:

- → A Profile is a set of permissions granting access to certain Squore features to a user
- → A Role is a set of privileges for a user within a Squore project.

A Squore user with the Administrator profile can manage users, their roles and profiles. A Squore user with the Project Manager role for a project can create a new version of this project or give access to another user to this project's analysis results.

3.1.1. User Profiles

You can use profiles to grant or deny access to the following Squore features:

- → Manage Server: Configure the server, access server logs, manage all projects.
- → Manage Users, Groups and Roles: Complete access to user management on the server.
- → View Models: Allows users to use the Viewer and the Validator.
- Use Capitalisation Base: Provides access to the Capitalisation Base feature to learn from past data in order to improve your model.
- Create Projects: Allows users to run analyses.
- Modify Models: Allows users to use the Dashboard Editor and the Analysis Model Editor, as well as view usage statistics for particular analysis models.
- Jse External Tools: View and use external tools configured by your Squore Administrator. To learn more about this feature, consult the Configuration Guide.
- → Manage Configuration: Allows users to reload the server configuration from disk.
- → View Online Help: Allows users to consult the online help from the web interface.
- → View User Manuals: Allows users to consult the product documentation from the web interface.

Three profiles are available by default, with permissions set as shown below:

| Profile 🔺 | Manage Server ¢ | Manage Users, Groups and Roles ¢ | View Models ¢ | Use Capitalisation Base ¢ | Create Projects ÷ | Modify Models ÷ | Use External Tools ¢ | Manage Configuration ÷ | View Online Help 🛊 | View User Manuals ¢ | Edit | Delete |
|---------------|--------------------|-------------------------------------|------------------|------------------------------|----------------------|--------------------|-------------------------|---------------------------|-----------------------|------------------------|------|--------|
| ADMINISTRATOR | \checkmark | \checkmark | | | | | | \checkmark | | | | Û |
| ADVANCED_USER | | | | | | | | | \checkmark | | ø | ŵ |
| STANDARD_USER | | | | | | | | | \checkmark | | ø | ŵ |

Default profiles for administrators, advanced user and standard user

Note that a profile can be assigned to a user or a group of users. It is therefore possible for a user be a member of more than one profile. In this case, the user's profile is the combination of all permissions from all the profiles they are a member of.

7

3.1.2. User Roles

A role is the set of privileges that a user enjoys in the context of a project. You can use roles to allow users to undertake these actions within the scope of a project:

- → View Projects: Allows a user to see a project in their project list and to browse this project's analysis results.
- Manage Projects: Allows a user to manage a project: rename it, create or delete versions, access project creation log files and add other user to the project team.
- → Baseline Projects: Allows a user to create a baseline version of a project that will not be overwritten by a subsequent analysis. For more information about baselining, see Section 4.3, "Working with Draft and Baseline Versions".
- View Drafts of Projects: Allows a user to view the current draft version of a project. Without this privilege, only baseline versions of a project are visible in the project portfolio. For more information about baselining, see Section 4.3, "Working with Draft and Baseline Versions".
- Modify Action Items: Allows updating the status of Action Items from TODO to Relaxed for example. Without this privilege, the status is displayed as a read-only field.
- Modify Artefacts Attributes: Allows user to modify the value of attributes displayed in the Forms tab of the Explorer. Without this privilege, attributes are read-only.
- Yiew Source Code: Allows user to click to view the source code of an artefact from any tab in the Explorer.
- Modify Artefacts: Allows user to add, delete, relax, exclude artefacts from the artefact tree. Users without this privilege, can still view artefacts created by others.
- → Modify Findings: Allows user to change the status of violations on the Findings tab. Users without this privilege, can view relaxed findings but cannot relax or unrelax them.

| Role 🔺 | View Projects ¢ | Manage Projects ¢ | Baseline Projects ¢ | View Drafts of Projects ¢ | Modify Action Items ¢ | Modify Artefacts Attributes ¢ | View Source Code ¢ | Modify Artefacts ÷ | Modify Findings ¢ | Edit | Delete |
|------------------|--------------------|----------------------|------------------------|------------------------------|--------------------------|----------------------------------|-----------------------|-----------------------|----------------------|------|--------|
| DEVELOPER | | | | | | | | | \checkmark | ø | ŵ |
| GUEST | | | | | | | | | | ø | Û |
| OWNER | | | | | | | | | \checkmark | ø | Û |
| PROJECT_MANAGER | | | | | \checkmark | | | | \checkmark | ø | Û |
| QUALITY_ENGINEER | | | | | | | | | \checkmark | ø | Û |
| TESTER | | | | | | | | | | ø | Û |

Six roles are available by default, with privileges assigned as shown below:

Default roles available for users in Squore

Note that a user can have multiple roles in a project. This allows a user to view the dashboard in the Explorer as a user from another role would. A **View As** option in the option menu of the Explorer allows to you to switch between the various dashboards available to you. When you have multiple roles in a project, you combine privileges from all the roles that you are a member of.

Тір

The owner role is assigned automatically to the user who creates the first version of a project. A project has only one owner, and you can control how much a project owner can see and do by modifying the permissions of the **OWNER** role. An administrator can transfer ownership of a project to a new user if required.

3.2. How Do I log into Squore?

Your Squore installation runs on http://localhost:8180/SQuORE_Server by default. By accessing this page in your browser, you will be redirected to the Squore login page, as shown below:

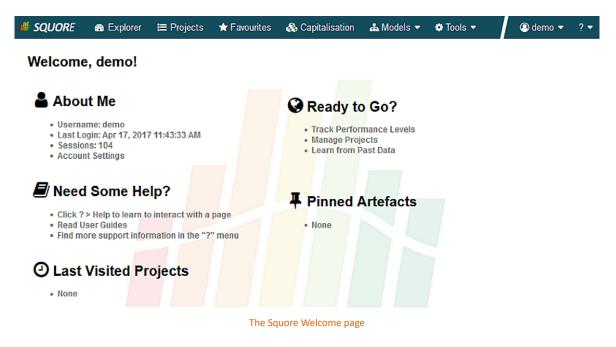

| & Please login | | |
|----------------------|-----------------------|----------------|
| Username Password | | |
| | Login Squore and | d your privacy |
| | The Squore login form | |

Type in a username and a password and click Login to log in.

3.3. Where Do I Go From Here?

To begin using Squore, log in as the demo user with demo as username and password on the login page. Click the **Login** button and wait for the Welcome page to open.

From the Welcome page, you can automatically return to the last projects or favourite artefacts that you had opened in the Explorer before logging out. You can also get links to the help and other features available for your account.

As the demo user, you are an advanced user of Squore and have access to the following functionality from the toolbar:

Ref : SUM_Squore

Version : 18.0.18 Date : 27/09/2019 9

https://www.squoring.com/

- → **Explorer**, where you can review your analysis results.
- → **Projects**, where you can launch new analyses and manage your projects.
- → Favourites, where you can view and manage your favourite charts across projects.
- → Capitalisation, where aggregated statistical data can be found.
- → Models, under which you can examine all characteristics of your model and edit your dashboards.
- Tools, which contains shortcuts to scripts that recreate demo projects. Note that only the demo user and members of the demo group have access to this menu by default.
- → **<username>**, where you can set your preferences and log out from Squore.
- → ?, where online help, user manuals and application information can be found.

Tip

If you are looking for the administration tools, log in as an administrator of Squore using admin as the username and password. You will gain access to the **Administration** menu where you can configure access management and administer the server.

3.4. How Do I log out of Squore?

You can log out of Squore by clicking your user name in the menu bar and selecting the **Logout** option. Note that if you close your browser without logging out, your session will automatically time out after two hours.

The Logout entry in the user menu

10

https://www.squoring.com/

3.5. Can I Tweak the Squore Look and Feel?

3.5.1. Using a Different Theme

The Squore look and feel can be adapted to your liking, with three provided themes, accessible from the **<username>** menu. Select one of the available colour schemes to change the color of the interface. Your changes are saved using a browser cookie.

11

https://www.squoring.com/

3.5.2. User Interface Language

Language selection in the user menu

You can use Squore in various languages. English and French are provided by default, and your Squore administrator can add more as needed. If you want to change the language of the Squore user interface, click the **<username>** menu option and click one of the flags available. The changes are applied immediately and your preferences are saved even after you log out.

12

https://www.squoring.com/

4. Creating Projects and Versions

In this chapter, you will learn about the various ways to create a project in Squore: using the UI, using a command line tool or triggering analyses in a continuous integration environment.

4.1. How Do I Create a Project in Squore?

Creating a project in Squore is as easy as following a wizard that will prompt you for information about the source material to analyse, and the external Data Providers to add to the analysis results.

The example below assumes that the source code for the sample project used is available on a network share. The path to the source files to analyse is relative to the server.

In order to create a project for the sample application Neptune2, follow these steps:

- 1. Access http://localhost:8180/SQuORE_Server in your browser. The log-in page appears.
- 2. Log in as the demo user with the login/password combination demo/demo.
- 3. Click the **Login** button. You are presented with the Squore home page.
- 4. Click **Projects** to switch to the projects view and click **Create Project** to create the Neptune2 project.
- 5. The General Information screen appears.

13

https://www.squoring.com/

| General Information Data Providers Rules Edition Confirmation | | |
|---|-------------------------------|------------|
| Project Identification | | |
| Project Name * | Neptine2 | |

The General Information screen

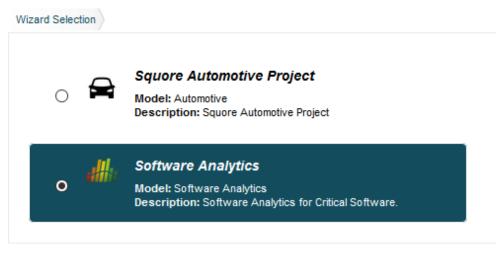

Note

If your Squore installation has been customised to provide more than one project wizard, you will see a **Wizard Selection** screen where you can choose which project wizard to follow. Project wizards allow you to use different analysis models and tools to analyse your projects. For this demo, click the **Software Analytics** wizard to start creating the project.

14

https://www.squoring.com/

The Wizard Selection screen

On this screen, you can enter the information relative to your project in the **Project Identification** section

Tip

Constal Information Data Dravidara

The **Version Date** field allows specifying a custom date for the analysis, so that different analyses can be placed correctly on a timeline later for certain charts in the dashboard. If you leave it empty, then the actual time at which you are running the analysis is used.

The Software Analytics model offers extra parameters below the Project Identification section, but you can ignore them for now.

6. Click the **Next** button. The **Data Providers** screen is shown:

| Contra monitation y Bata Providers y Rando Edition y | | | |
|--|--|-----------------------------|--------|
| - Specify Repository Locations | | | |
| ● Folder () Zip Upload () ClearCase () | Git OPTC Integrity OPerforce OSVN Datapath (\\server\share\samples\c\Weptune\\\2 | | 0 |
| Add repository Select Data Providers | | | |

| CodeSniffer | 🗌 Jira | ReqIF | |
| Previous Next Finish | | | Cancel |

The Data Providers options screen

This screen allows configuring the repository locations and tools that will be used in your analysis. Set the source code files option to **Folder**. In the **Datapath** text box, type the path to the Neptune2 source code: \\server\share\samples\c\Neptune\W25.

The only Data Provider used in our analysis is Squan Sources, the source code analyser, so you can leave all the other tools unchecked.

Tip

If you want to learn more about the available Repository Connectors and Data Providers, consult Chapter 12, *Repository Connectors* and Chapter 13, *Data Providers*.

In the Squan Sources parameters, ensure that **C** is one of the programming languages selected, as shown below:

| General Information Data Providers Rules Edition Confirmation | | | |

The table displays the entire model's ruleset, which you can filter and sort by data provider or category. Each rule can be turned on or off, and you can click the Edit button to adjust the categories for each rule. Note that any modifications from the original configuration are displayed with an asterisk.

Click the **Next** button when you are satisfied with your modifications. Note that your modifications are applied for any subsequent analysis of this project and do not affect other projects using the same model.

Note

This screen may not be enabled in your wizard, as your administrator may have disabled it in your configuration. Your administrator can also decide to make modifications to the ruleset that apply to any project created with this model using the Analysis Model Editor. Consult Section 5.3.4, "Analysis Model Editor" and Section 5.3.5, "Using Ruleset Templates" to learn more.

8. Before launching the analysis, a summary of your selections is displayed. Review the information and click **Run** to confirm the project creation.

Тір

The summary page lists all lists all the options you specified for the project creation and also allows outputting them in various formats so that you can repeat the project creation in command line. For more information about reusing the project parameters in a different context, consult the online help or Section 4.5, "Can I Create a Project Via the Command Line?".

When the project analysis completes, Squore shows you the list of projects. Neptune2 appears in the list, together with information about the current version and its computed rating:

| _ | | Name 🗢 | Version ¢ | Rating | Analysis Model \$ | Colour ¢ | Owner 🕈 | Build Time 👻 | Manage | Build | Apply Changes | Baseline | Delete | Status 🗢 |

| | ۲ | Neptune | W25 | 0 | Software Analytics | | demo | Jun 7, 2018 5:00:47 PM | æ | 00 | C | | Û | Successful |
| | ۲ | Earth | Current (V7) | 0 | Software Analytics | | demo | Jun 7, 2018 5:00:33 PM | | 00 | C | I | Û | Successful |

To consult the results of the analysis, click on the project name to view the Squore Dashboard. More information on how to read the Dashboard is available in Section 4.9, "Where Are My Analysis Results?".

4.2. Creating Version 2 of My Project

Adding a version to an already-existing project is a simple procedure that is carried out from the **Projects** page.

Follow these steps to create version 2 of your project:

- 1. After logging into Squore, click on **Projects**.
- 2. Click the **Build** icon

O.

(for the Neptune2 project in order to access the source code file options.

3. The first screen of the wizard enables you to specify the version name and to modify some of the project attributes if necessary.

4. Click the **Next** button to reach the project language and source settings screen. On this screen, you can modify the path to the source code and point to the newer version. Note that by default, Squore displays the path used when analysing the last version. Leave the path as it was for version 1. We are going to create a version that analyses the same code in this example. If you scroll down to the code analysis

19

https://www.squoring.com/

SQUORE

Getting Started Guide

option, you will notice that some of them are now disabled. This is because the project configuration was set in version 1 and is not allowed to be modified in subsequent analyses. This ensures that your project is scored using the same criteria every time you analyse new code.

Unavailable options when creating version 2 of a project

Note: You can add new sources to the project at this stage if needed. Read more about projects using sources spread over multiple locations in Section 4.8, "Can I Create Projects with Sources From Multiple Locations?".

5. Click **Finish** and **Run** to launch the analysis of Neptune2 V2. When the analysis finishes, Neptune2 V2 will be listed in the list of projects on the Projects page.

4.3. Working with Draft and Baseline Versions

This section covers an essential workflow feature of Squore: baselining. While it is possible to keep every version of a project created in Squore, you may want to permanently keep analysis results only for particular milestones and work with an always updating draft version.

20

You can decide whether a version is a draft or a baseline when you create it, or after the analysis is finished.

4.3.1. Drafts and Baseline: The Basic Concepts

The most important thing to remember about a draft version is that it is a snapshot of your data at a given time. You can use it to compare the evolution of your project against the last baseline created. There is therefore only one draft version available per project (the latest version), which Squore creates automatically if your previous version was a baseline. A baseline version, on the other hand, is permanently saved and will not be overwritten the next time an analysis is launched.

When you create a draft version, it is always called Current and can be modified in several ways:

- → Forms can be updated
- → Attribute values can be modified so that a new value is taken into account in the next analysis
- → Artefacts can be manually added, modified or deleted
- → Folders and files can be relaxed or excluded from the project
- → Action Items can have their status changed
- → Rules and individual violations can be relaxed

Being able to view draft versions of a project is a user privilege that can be granted to users of a particular role, and so is the ability to baseline a project. For more information about roles, refer to Section 3.1, "Understanding Profiles and Roles". This means that as a project manager, you can give access to every version to users within your team, but can restrict the project visibility to the rest of the company to show them only baselined versions. You can also decide which members of your team are allowed to change the status of a version from draft to baseline.

4.3.2. Baselining at Version Creation

Use the Automatic Baselining option on the General Information screen of the project wizard to create a draft or baseline as follows:

- → When the Automatic Baselining box is unchecked, a draft version is created and all subsequent versions will be draft versions by default.
- When the Automatic Baselining box is checked, a baseline version is created and all subsequent versions will be baseline versions by default.

4.3.3. Baselining After Review

You can use the Baseline option on the Projects page to create a baseline version of the current draft as follows:

1. Log into Squore and click on **Projects**.

| 2. | Click | the | | Baseline | icon |
|----|--------------------------------------|-------------|----------|----------|------|
| | (next to the project you want to | o baseline. | | | : |

3. Click the Baseline button to confirm.

After confirming the baseline creation, you are redirected to the Projects page and the last draft version becomes the new latest baseline. All changes made manually to artefacts and findings are kept, and will be incorporated the next time an analysis runs. Note that baselining is only available for users whose role allows the **Baseline Projects** privilege. For more information about roles, consult Section 3.1, "Understanding Profiles and Roles"

Note

Baselining manually is useful if you have reviewed the current draft and have not made any changes to the analysis results. If you have modified form entries or relaxed artefacts and findings in a way that should impact the rating, consider launching a new build or using the Apply Changes button instead of baselining. See Section 4.3.4, "Handling Manual Modifications" for more information.

4.3.4. Handling Manual Modifications

When you have made changes to form values or you have relaxed artefacts and findings in the current draft, there are two ways to get these changes reflected in the dashboard:

- → running a new analysis
- → clicking Apply Changes

Running a new analysis will allow you to change the source code repository settings and input files for data providers, or keep them. You can choose if this new analysis should produce a baseline or a draft version. In all cases, the artefacts you relaxed or excluded, the action items you modified and the findings you relaxed are taken into account to produce the rating of the new version.

| Clicking | Apply | Changes |
|----------|----------|---------|
| (| c | |

allows you to merge the manual modifications to artefacts, forms, action items and findings into a new draft version without reanalysing source code and re-running data providers. Manual modifications are simply merged with the already- existing results to update the rating, which is a lot faster than running a full analysis. Note that Apply Changes is not available when you have excluded artefacts.

Tip

You can also use Apply Changes after modifying your analysis model to migrate a project to the new version of a model without running a full analysis.

4.4. Can I Make Changes to My Project?

There are three types of changes you can make to Squore projects:

- → Changes to attribute values
- → Changes to source code locations
- Changes to some of the Data Provider options

Project attributes are always editable when creating a new version of a project, except for the name of the project.

The location of the source code can always be modified. When editing a project, you can also add more source locations as needed, following the steps described in Section 4.8, "Can I Create Projects with Sources From Multiple Locations?".

Whether you can edit the settings used in the Data Providers for the project depends on their ability to support edits. This ability is defined by a Squore administrator via the configuration of the Squore wizards. For more information, refer to the Squore Configuration Guide.

4.5. Can I Create a Project Via the Command Line?

Instead of creating a project from the Squore web interface, you can create a project directly from the command line using Squore CLI. Squore CLI is a client for Squore that enables you to create and analyse projects locally and send the results to Squore Server. Alternatively, you can use Squore CLI to instruct Squore Server to carry out the analysis.

If you have installed Squore CLI on your computer, you can call it using Java, passing the parameters you would have passed in the web interface to create projects. The following is an example of the command line you can use to create a project using Squore CLI on Windows:

```
@echo off
java -Dsquore.home.dir="%SQUORE_HOME%" ^
-jar %SQUORE_HOME%\lib\squore-engine.jar ^
--url=http://localhost:8180/SQuORE_Server ^
--commands=DELEGATE_CREATION ^
--name=Mars2 ^
--repository "type=FROMPATH,path=\\server\share\samples\c\Mars2\V3.2.6" ^
--color=rqb(103,25,237) ^
--version=1.0 ^
--login=demo ^
--password=demo ^
--filter=APPLICATION,MEASURE,LEVEL ^
--wizardId="ANALYTICS" ^
--dp "type=SQuORE"
echo done
pause
```

The example above shows how to specify commands, parameters and project options to Squore CLI. This would create a project named **Mars2** in version **1.0**, analysing source code located in **\\server\share\samples \c\Mars2\V3.2.6** with the Data Provider **SQuORE** (the internal name for Squan Sources).

You can find more information about using Squore CLI in the Command Line Interface manual, which explains how to install the client and create projects.

4.6. How Do I Connect Squore to My Continuous Integration System?

If you use a Continuous Integration tool like Jenkins or CruiseControl, you can add Squore to your build process and analyse projects every time your code is compiled. This requires the installation of Squore CLI on the continuous integration server, and is therefore described in greater details in the Command Line Interface Manual.

4.7. Can Squore Pull Source From My Version Control System?

The source code analysed by Squore does not have to be located on the same machine as Squore Server or Squore CLI. When you create a project, you get the option to choose from a range of Repository Connectors to pull source code from:

- → Direct file system access (local drive, network share, mass storage media...)
- → Zip upload
- → A ClearCase view
- → A CVS checkout
- → Git cloning
- → An Integrity repository

Ref : SUM_Squore

Version : 18.0.18 Date : 27/09/2019

- → A Perforce depot
- A Subversion revision
- → A Synergy database
- → A TFS server

Each option requires different parameters, which can be specified from the project wizard, or via the command line. For more information, refer to Chapter 12, *Repository Connectors*.

4.8. Can I Create Projects with Sources From Multiple Locations?

Squore provides support for analysing projects whose sources are spread over several locations or version control systems. If your source code resides in /products/common and /projects/myproject, you can specify these two locations in the Squore project wizard by clicking the **Add Repository** button. Similarly, if some of your code is managed by a SVN repository and the rest is handled by a Git server, you can configure both locations as part of the same project, as shown below:

24

https://www.squoring.com/

4.9. Where Are My Analysis Results?

Now that you have created a project, you are ready to start reviewing the analysis results in the main section of Squore, the Explorer, which consists of a set of trees for browsing through project artefacts and various dashboards to display the information associated with these artefacts.

25

https://www.squoring.com/

SQUORE

Getting Started Guide

The Squore Explorer

Common icons are used throughout the explorer to indicate the rating of a component and its evolution compared to the previous version. The image below shows the meaning of the different icons used:

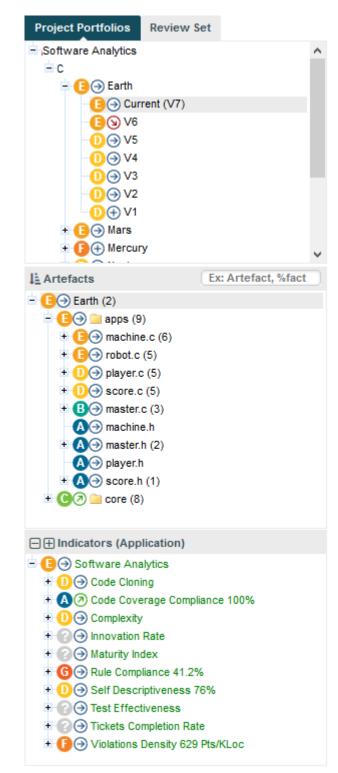

4.9.1. The Tree Pane

The left-hand part of the Explorer is a three-panel section containing expandable trees.

26

https://www.squoring.com/

The Tree Pane

The top panel contains the **Project Portfolios** and the **Review Set**.

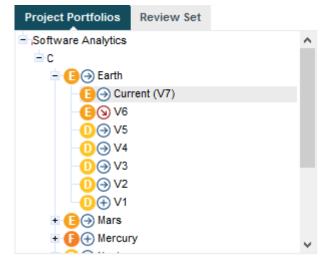

27

https://www.squoring.com/

The Project Portfolios is a list of all the projects you have access to, grouped by analysis model. Each project is listed with its latest rating and evolution and can be expanded to show all versions of the project that were analysed with Squore.

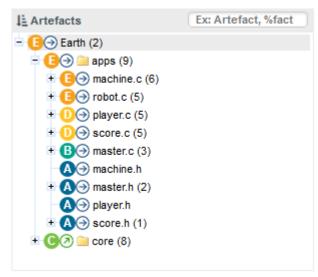

The Review Set is a flat list of artefacts you collect from various projects in order to review them. This list is saved when you log out and log into Squore again.

The expanded Earth project, rated E, and its 7 versions in the Project Portfolios

The tree in the middle panel is the **Artefact Tree**. When Squore analyses a project, it breaks it down into artefacts of various configurable types, down to the function-level for source code, according to the analysis model used. The artefacts in the tree are displayed for the version selected in the Project Portfolios. clicking a different version of a project refreshes the artefact tree with the ratings for the version just selected. Above the artefact tree are tools for sorting and searching artefacts. Each artefact is displayed with its current rating and can be expanded to reveal child artefacts if available. The number in brackets indicates the amount of child artefacts for the current artefact. You will learn about these tools later in Section 5.1, "Has the Quality of My Project Decreased Since the Previous Analysis?" and Section 5.2, "How Do I Find and Keep Track of Artefacts?".

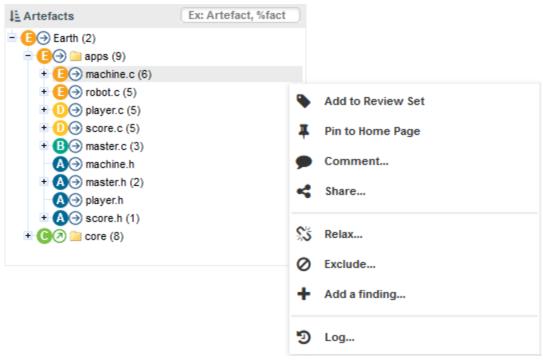

The Artefact Tree for version 7 of the Earth project

Tip

You can also interact with artefacts in the tree by using the Artefact Context Menu which can be accessed by hovering over an artefact name and clicking the menu icon.

The Artefact Context Menu

The bottom panel is the **Indicator Tree**, in which ratings for the indicators defined in the analysis model at the current level are displayed. Each indicator can be expanded to display the rating of each of its sub-indicators. The Indicator Tree displays statistics for the artefact currently selected in the Artefact Tree and refreshes when

the selection is changed. The type of artefact selected in indicated in brackets. Two shortcut buttons can be found above the top node to quickly expand and collapse the entire tree.

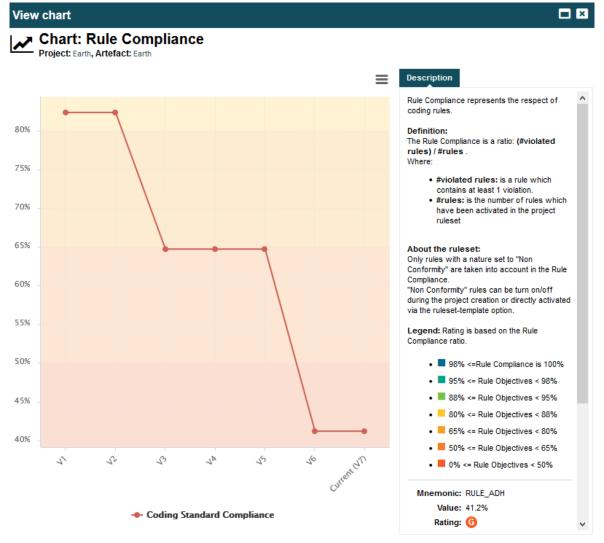

The partly expanded Indicator Tree for version 7 of the Earth project at Application level

Clicking one of the tree nodes reveals more information about the indicator, including the formula used by Squore to compute its value and rating.

SQUORE

Getting Started Guide

The popup displayed when clicking the Complexity Distribution indicator at application level

4.9.2. The Dashboards

The right-hand side of the Squore Explorer contains a series of tabs, the first of which is the Dashboard. The Dashboard is dynamic and always displays information about the artefact currently selected in the artefact tree. There is not one Dashboard, but a Dashboard per node in the tree. Additionally, the Dashboard can be customised by a Squore administrator so that users see a different Dashboard according to their role in a project, thus highlighting different information for project managers, quality engineers and developers for example. Ask your Squore administrator about Dashboard customisation, or refer to the Squore Configuration Guide for more information.

The left-hand area of the Dashboard contains the score card , which consists of a graphical representation of the key performance indicator for the current artefact, and some tables highlighting key metrics about the project.

https://www.squoring.com/

| | nce Indicator |

| Self Descr Coding Rule Rule Compliance | s Compliance 41.18% = |

Ref : SUM_Squore

Version : 18.0.18 Date : 27/09/2019 32

https://www.squoring.com/

Each table lines display a series of details about the key performance indicator:

- The name of the metric (e.g. Rule Compliance). When clicked, a popup shows the way the metric is computed. Optionally, some metrics may allow an extra link to be displayed. This link shows the list of findings taken into account when calculating this metric (See Non Conformity Count).
- The raw value of the metric and its evolution according to the previous version (e.g. 41.18%). Clicking a value ion this column displays a chart of the history of the last 10 values recorded for this metric.
- If the metric displayed is an indicator, the rating of the indicator is displayed, along with its evolution (e.g. Level G, deteriorated). If the metric is a measure, then an information icon is shown. In both cases, you can click the information in this column to display more details about how the metric is computed.

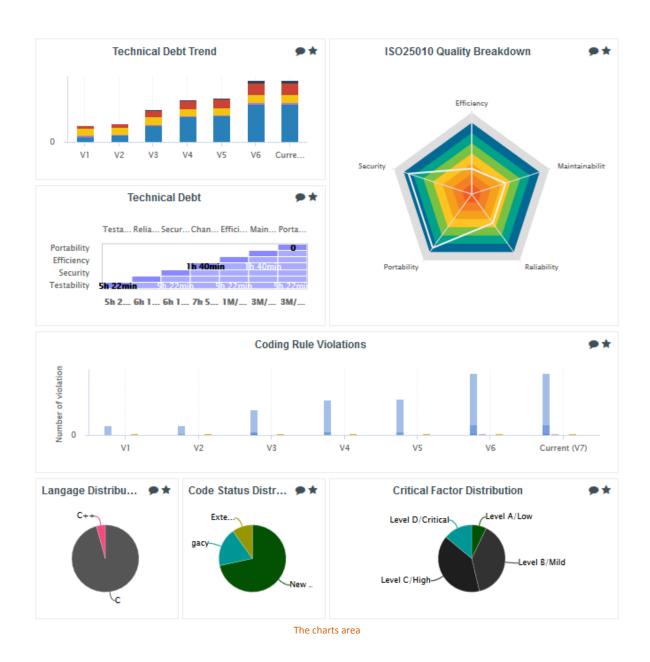

The right-hand area of the Dashboard contains a series of charts representing key information about the current artefact. Clicking a graph opens a larger version of the image so you can analyse the data. Note that the available charts will differ depending on the type of artefact selected in the tree. Files and functions for example include a **Source Code** chart (for users who have the privilege to browse source code), which does not appear in the Dashboard for folders and applications.

33

https://www.squoring.com/

SQUORE

Getting Started Guide

The Dashboard is only the first of a series of tabs in the Explorer. In the following chapter, you will find out more about the role of the **Action Items**, **Highlights**, **Findings**, **Forms**, **Reports**, **Indicators**, **Measures** and **Comments** tabs. Note however that like the Dashboard, the information displayed in each tab is always relative to the node currently selected in the Artefact Tree.

4.10. Creating Meta-Projects

In contexts where your projects reuse code from other projects that you also analyse in Squore, you can create a meta-project that will show the analysis results from the various software bricks in a single project.

https://www.squoring.com/

Note

This feature is not enabled by default in the standard configuration, so consult your Squore administrator to make the necessary changes to your model, following the instructions described in the Configuration Guide.

| Wizar | d Seleo | tion | | |
|-------|---------|----------------|---|--------|
| | 0 | :tilit: | Software Analytics Model: Software Analytics Description: Software Analytics for Critical Software. | |
| | 0 | 11 11 11 | Software Analytics Meta-Project Model: Software Analytics Description: This wizard lets you build a project made of components that are other projects from your portfolio. The Software Analytics model will be used to compute the overall rating of the meta-project. | |
| Pre | vious | Next | | Cancel |
| | | | Selecting a wizard for building meta-projects | |

When you select a wizard that allows to create a meta-project, you do not have to specify any locations for source files or any data providers to run. Instead, you are presented with a project picker that allows you to tell Squore which sub-projects compose your meta-project. In the example below, we will create a project that uses Earth (V2), Mars (v3.2.6), and Saturn (Prel) as its parts. You can choose any baseline version of any project you have access to in Squore as a component of your meta-project.

| Wizard Selection | General Informati | on Data Pro | viders Confirmation |
|-------------------|-------------------|-------------|---------------------|
| Project Name | Version | Remove | |
| Earth | V2 | ~ × | |
| Mars | V3.2.6 | ~ × | |
| Select a project: | Saturn | | |

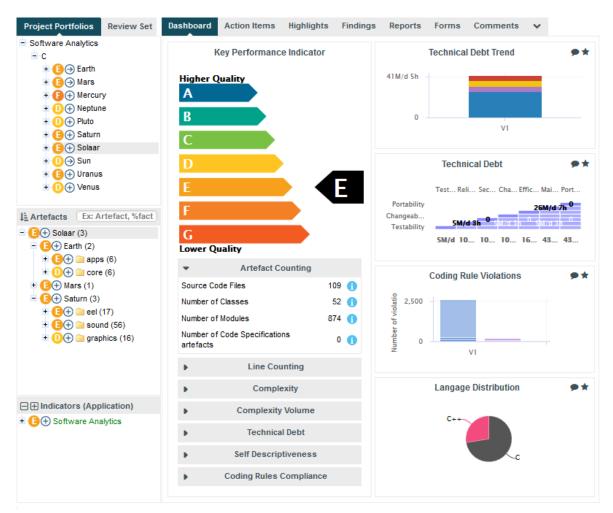

Building a new meta-project with code from Earth, Mars and Saturn

When the analysis finishes, the meta-project is listed along with the other projects in the Project Portfolios. You can expand the Artefact Tree for your meta-project to browse the artefacts of the three sub-projects that are part of your meta-project, and consult all their Action Items, Findings and Highlights.

35

https://www.squoring.com/

The dashboard for the meta-project Solar, composed of Earth, Mars and Saturn

36

https://www.squoring.com/

5. Understanding Analysis Results

This chapter describes the main features available in the Explorer. By the end of the chapter, you should be able to make the most of the information and decisions presented by Squore and start applying them to improve your development practices.

5.1. Has the Quality of My Project Decreased Since the Previous Analysis?

After completing the analysis of a new version of your project, you will probably want to investigate how it has evolved, more specifically for which artefacts the quality has decreased. Let's look at the history of the Earth Project (which should be available if your Squore administrator has created the sample projects shipped with the Squore installation) to find out how to spot the worst-scored components in your project.

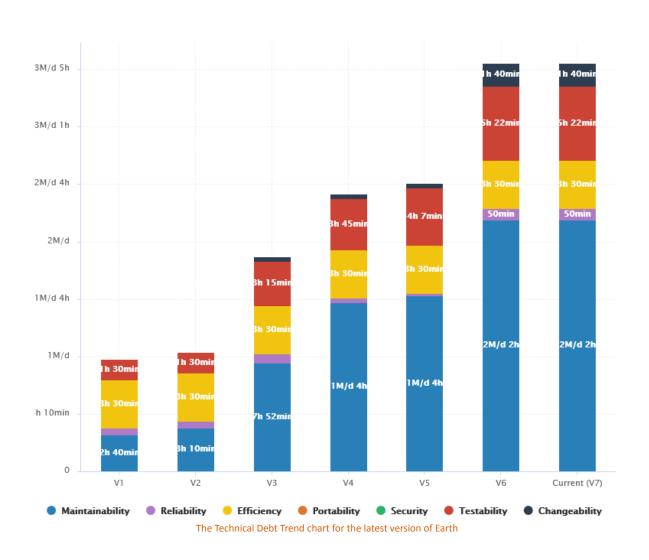

Log into Squore as the demo user using demo/demo and observe the evolution of the Earth project in the Project Portfolios:

The trend arrows before the version names in the the Project Portfolios indicate that the overall rating has recently detetiorated (More information about the quality indicator icons is available in Section 4.9, "Where Are My Analysis Results?"). If you take a closer look at the Technical Debt Trend chart, you can notice that the technical debt is growing for this project.

SQUORE

Getting Started Guide

Тір

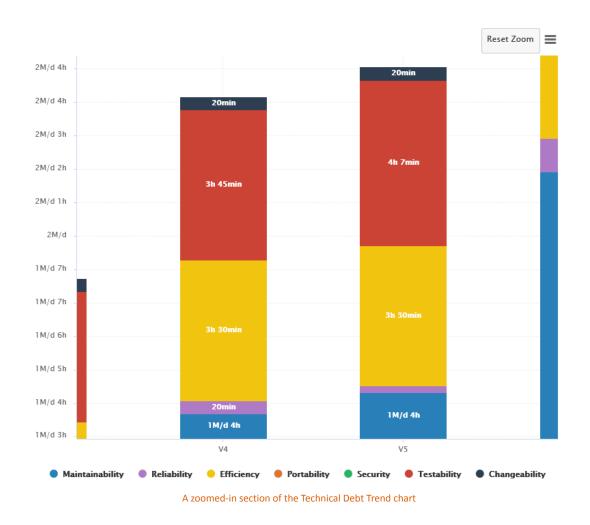

You can zoom in on the chart by dragging your mouse over the section of the data you are interested in. After zooming in, you can keep the selected zoom level and move around the chart by holding the **Shift** key and dragging the chart around, or go back to the original view by clicking the **Reset Zoom** button in the chart viewer.

38

https://www.squoring.com/

SQUORE

Getting Started Guide

Since the trend accelerated in V6, we will focus on this version. Let's click V6 in the tree and start our evaluation by looking at the score card, which rates Earth at E.

Let's also look at the **Developer** dashboard, which offers more insight into coding violations. Select **View As** > **Developer** in the Explorer menu:

| Dashboard | Action Items | Highlights | Findings | Reports | Forms | Comments | ~ | | |
|--|--------------|------------|----------|---------|-------|----------|---|---------------------|--|
| | | | | | | | B | View as (Developer) | |
| The View As menu allows to switch roles in the project | | | | | | | | | |

Some values under Artefact Counting, Line Counting and Issue Distribution explain the lower score: the application contains more files and functions, more lines of code, less comments and more rules violations.

39

https://www.squoring.com/

| I | Key Performan | ce Indic | ator | |
|----------------------------|-------------------|-----------|-------------|---|
| Higher (| Quality | | | |
| Α | | | | |

The score card for the version V6 of Earth

40

https://www.squoring.com/

By now you probably want to find out which components in your project are responsible for increasing the technical debt the application in this version. If you want the Artefact Tree to reflect this information, you can change the sort order to show the worst scores first by clicking on the **sort** icon

E

(

and selecting LEVEL > Worst first to display artefacts from worst-scored to best-scored.

5.1.1. Finding Artefacts Using Filters and Search

This section explains the basics of looking for artefacts using filters and search. For a more automated way to find artefact that fit a specific category, take a look at Section 5.1.3, "Finding Artefacts Using Highlights".

Click the Filter icon
(
(
(
)
in the top-right corner of the Explorer to reveal the Filter Panel. The Filter Panel allows you to set criteria

in the top-right corner of the Explorer to reveal the Filter Panel. The Filter Panel allows you to set criteria that artefacts need to meet in order to be displayed in the artefact tree or taken into account in charts on the dashboard (new in 18.0). For this example, we want to restrict the visibility of artefacts to those rated E and lower:

41

)

https://www.squoring.com/

The Filter Panel with the boxes checked to filter artefacts rated E and lower

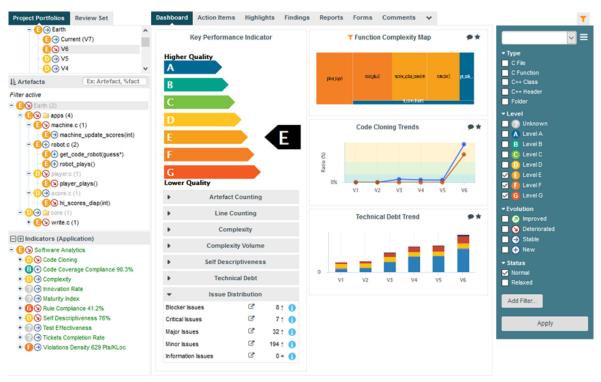

Click **Apply** to apply the changes The Artefact Tree and the dashboard refresh to show results for the artefacts in the levels selected, as shown below:

42

https://www.squoring.com/

SQUORE

Getting Started Guide

The filtered Explorer showing artefacts rated E and lower

The notice **Filter active** is always displayed above the Artefact Tree and the filter icon turns orange when you are using a filter. The tree now only shows artefacts rated E and lower, along with their ancestors, which are greyed out (new in 18.0) if they are not rated E and lower. On the dashboard, the charts that support displaying filtered information are highlighted with an orange filter icon

Т

(

as in the Function Complexity Map (new in 18.0).

Tip

You can save your filter for later use and even share it with other Squore users (new in 18.0) by clicking the hamburger menu in the Filter Panel and giving your filter a name.

43

)

https://www.squoring.com/

| Save Filter | | × |
|---------------------|---------------------------|---|
| Name Make Public | worst rating |] |
| All Projects | | |
| | Save Cancel | |
| | The filter saving options | |

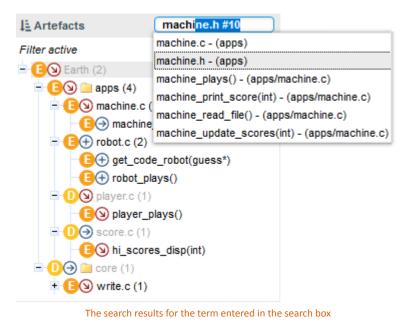

Saved filters are displayed in the dropdown list at the top of the Filter Panel so you can reuse them later.

| | \mathbf{T} |
|---------------------------|--------------|
| worst rating 🗸 🗸 | |
| | |
| [Default Filters] | |
| [Reset Values] | |
| worst rating | |
| The list of saved filters | |

For more details about advanced filtering functionality in Squore, consult Section 5.1.2, "Advanced Filtering".

While a filter is active, you can still search for other artefacts by typing a search term in the search box. Try typing **ma** in the search box above the Artefact Tree, and watch the search results list get populated as you type:

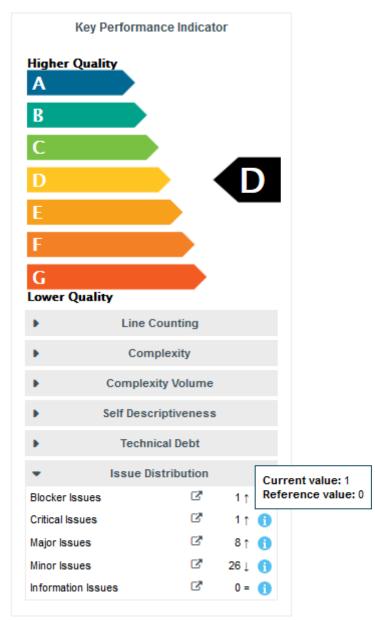

If you select the highlighted search result in the list above, you will open the dashboard for machine.h.

Let's go back to our filtered tree. The filter singled out three files whose rating deteriorated that contain functions in the required score range: player.c, machine.c and write.c. Click on the artefact player.c to view its dashboard. Note how the score card indicates that the artefact has more critical issues than in the previous analysis.

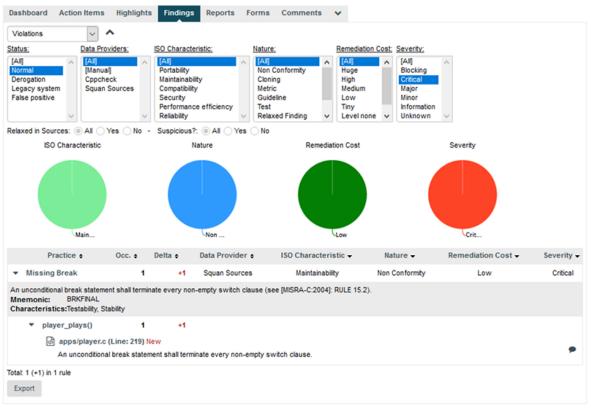

One more critical issue for player.c in this version

You can click the link in the table to directly view the new critical violation on the Findings tab. In this case, the rule **BRKFINAL** was broken:

46

https://www.squoring.com/

A new critical issue for player.c in this version

Another convenient way to try and find why a project's quality is deteriorating is to filter on the trend of an artefact.

Select version V6 of Earth again and edit the active filter: Uncheck the boxes for levels E and lower, and select the **Deteriorated** category in the Evolution section. When applying the filter, you should see the artefacts in the tree that have the

 (\mathbf{a})

icon next to their name.

The artefacts that deteriorated in version V6 of Earth

The files you inspected earlier are still here, but there are more deteriorated artefacts that you can start reviewing. If you click on hi_scores_disp(int) for example, which is rated E.

In order to find out where the degradation took place, you can look at the indicators tree to understand where the decline in quality comes from. Expand all the nodes in the indicators tree to reveal the issues with the artefact:

The Indicator Tree for hi_scores_disp(int)

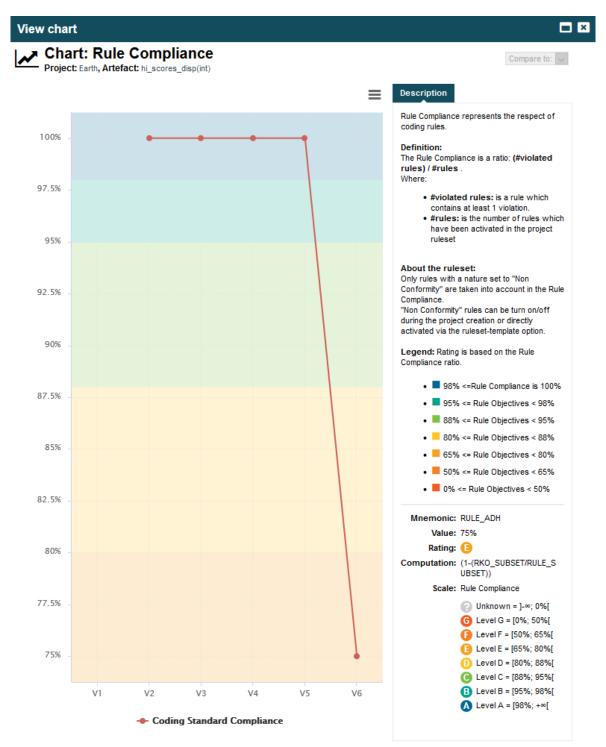

Squore makes it easy to spot the irregularities quickly, like the fact that the **Rule Compliance** indicator is one of the causes for the worse score in this version. This is probably the first item to review in this function.

48

https://www.squoring.com/

By clicking the Rule Compliance indicator in the tree, you can learn more about its history and how it is computed:

The description and history of the Rule Compliance indicator for hi_scores_disp(int)

49

https://www.squoring.com/

Finally, you can take a look at the Coding Rules Compliance section of the artefact's scorecard to confirm the results:

The scorecard for hi_scores_disp(int)

By clicking the link icon, you can directly view the violations for this artefact in the Findings tab.

You can dive further into the analysis results by looking at the information contained in other tabs and assign action items to your team by referring to Chapter 6, *Managing Your To-Do List With Squore* or report your progress as explained in Chapter 10, *Communicating With Squore*.

5.1.2. Advanced Filtering

In the previous section, you learned how to filter artefacts based on their overall rating or trend, but Squore allows you to filter on more than the artefact's main indicator. This section covers filtering on more than one metric, and how you can also save and share your filters with other Squore users.

This example explores how to develop a strategy to reduce cloning in your application by finding the artefacts with the highest cloning that have also been modified since the previous analysis.

Start by displaying the dashboard for version V6 of Earth. In the Filter Panel, clear any existing filter by selecting **[Default Filters]** and clicking **Apply** to go back to an unfiltered dashboard.

The [Default Filters] in the Filter Panel

In order to find artefacts that have recently been modified, use Squore's Stability Index indicator, a feature of the source code parser that computes the amount of changes in a file since the previous analysis. Add a filtering criterion by clicking **Add Filter...** in the Filter Panel. A popup appears so you can type the name of the indicator to filter on. Type **stability** and select **Code Stability Index** as shown below:

Version : 18.0.18 Date : 27/09/2019 51

https://www.squoring.com/

| Add Filter | | × |
|----------------------|--------------------------------------|---|
| Filter on: | ● Indicator ○ Measure ○ Information | |
| Name: | stability | |
| Filter on evolution: | Code <mark>Stability</mark> Index SI | |
| | Stability Index Average AVG_SI |] |

The Filter Panel showing metrics whose names match stability

Clicking **Add** updates the Filter Panel with a section where you can select **Code Stability Index** levels to filter on. Since 100% means no changes, select all the levels except for 100%:

| _ = |
|---|
| ▶ Туре |

The Code Stability Index filter in the Filter Panel (other filters minimised for clarity)

In order to find artefacts with the worst cloning, click **Add Filter...**, select **Measure** and find the metric called **Cloned Code (CC)**. Configure this filter as a slider so we can dynamically change the range of cloning to look out for:

52

https://www.squoring.com/

| Add Filter | | × |
|----------------------|---|---|
| Filter on: | O Indicator Measure Information | |
| Name: | Cloned Code (CC) | |
| Display Type: | Range of values (Sliders) Multiple Values (List) | |
| Filter on evolution: | | |
| | Add Cancel | |

The slider option selected for the Code Cloning metric in the filter popup

Click **Add** to add your filter. The slider shows you the minimum and maximum values for cloning in this project. Values can be modified either by entering values in the text boxes or by moving the sliders left and right. Move the left slider to about half the range for Code Cloning.

53

https://www.squoring.com/

The slider for Code Cloning in the Filter Panel

When clicking **Apply** to view the results of your filter, the artefact player.c is singled out as a recently modified file with high cloning. By switching to the **Tester** dashboard, you can view details about its stability index in the score card.

Version : 18.0.18 Date : 27/09/2019 54

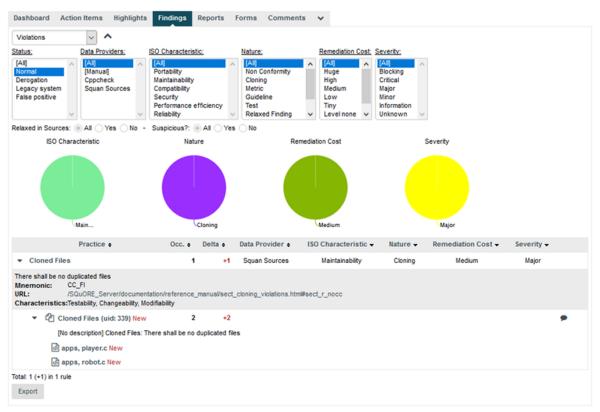

https://www.squoring.com/

| Stabilit | y Index Information | |
|------------------------------|---------------------|----|
| Code Stability Index | <mark>81%</mark> ↓ | 80 |
| Executable Stateme | nts 142 ↑ | 0 |
| Lines Modified | 4 ↑ | 0 |
| Lines Added | 3↑ | 0 |
| Lines Removed | 46 ↑ | 0 |

The Stability Index Information for player.c

Clicking the Findings tab allows you to confirm that the cloning detected by Squan Sources was indeed introduced since the latest analysis.

The new cloning violation for player.c

Since this is a new finding in a recently modified file, it makes sense to address the issue to avoid creeping technical debt in the project.

If you want to repeat this exploration at a later time, you can save the filter you just created.

Getting Started Guide

| | τ. |
|-----------|----|
| | |
| Save | |
| 🖺 Save as | |
| Remove | |

In order to save a filter, click the hamburger menu in the Filter Panel and select **Save as...**. The **Save Filter** popup appears and gives you the option to:

- → Name your filter
- → Make it public so other Squore users can apply it and adopt the same cloning exploration practice
- → Make it available across all projects in Squore

| Save Filter | | × |
|-----------------------------|------------------------------|---|
| Name | High cloning - recent change | |
| Make Public All Projects | | |
| | Save Cancel | |

After you save a filter it becomes available in the drop down list of filters in the Filter Panel:

| | T |
|-----|------------------------------|
| | High Cloning - recent cl 🗸 🚍 |
| [D | efault Filters] |
| [R | eset Values] |
| Hig | gh Cloning - recent change |
| w | orst rating |

Tip

There are more filtering options for metrics and textual information you can explore directly in Squore's web interface and online help.

5.1.3. Finding Artefacts Using Highlights

In the previous section (Section 5.1.1, "Finding Artefacts Using Filters and Search"), you got familiar with searching and filtering to find the artefact that have a negative impact on the overall rating of a project. in this section, you will learn to master the Highlights functionality, which aims to make the process of finding certain categories of artefacts easier and allows to display additional information about each artefact.

Highlights are flat lists of artefacts ordered in predefined categories for a model.

Let's try to confirm our findings about the worst and most deteriorated artefacts in Earth. Click on the version V6 of Earth and clear the filter. Click the **Highlights** tab of the Explorer and select the **Top 10 worst artefacts** category. The list appears as shown below:

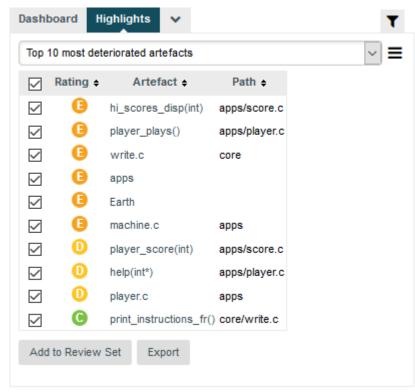

| Dashb | oard Hi | ghlights 🗸 | | 1 |
|--------------|--------------|----------------------------|----------------|---|
| Top 1 | 10 worst art | tefacts | | ~ |
| | Rating + | Artefact + | Path + | |
| \checkmark | 0 | robot_plays() | apps/robot.c | |
| \checkmark | 0 | player_plays() | apps/player.c | |
| \checkmark | 0 | Earth | | |
| \checkmark | 0 | robot.c | apps | |
| \checkmark | 0 | write.c | core | |
| \checkmark | 0 | apps | | |
| \checkmark | 0 | machine_update_scores(int) | apps/machine.c | |
| \checkmark | 0 | instruction() | core/write.c | |
| \checkmark | 0 | get_code_robot(guess*) | apps/robot.c | |
| \checkmark | 0 | machine.c | apps | |
| Add | to Review \$ | Set Export | | |

The Top 10 worst artefacts in the current version of Earth

The list confirms that some fo the worst-rated artefacts are the ones you explored before. The Highlights table shows you the artefact rating, name and path, and allows you to go to the artefact's dashboard directly by clicking the artefact name.

Now you can also find the deteriorated artefact hi_scores_disp(int) that you identified with a filter earlier in Section 5.1.1, "Finding Artefacts Using Filters and Search": select the **Top 10 most deteriorated artefacts** highlight category to see the artefact appear in the list of deteriorated artefacts in this version.

The Top 10 most deteriorated artefacts in the current version of Earth

Artefacts are sorted by degradation, i.e. the difference between the value of the main indicator in the previous baseline version compared to the current value. By clicking the **Export** button, you can export the selected items to a CSV file. If the **Export** button is greyed out, your licence does not include the option to export data to CSV files.

Тір

By default, the list of most deteriorated artefacts is compiled based on the previous version. By using the Reference list in the Explorer Settings menu)and (choosing another reference version, you can update the statistics based on the new reference version you just selected.

5.1.4. Creating Highlight Categories

From the Highlights tab, you can also create new highlight categories (new in 18.0). These new categories, like your filters can be saved and shared with other Squore users.

Let's extract more data from the artefacts singled out by your advanced filter in Section 5.1.2, "Advanced Filtering", where you found recently modified code with a high cloning ratio. To begin, simply select your saved filter from the Filter Panel and apply it. As you apply and modify the filter, the list of artefacts for the current highlight responds to the filter parameters:

| Project Portfolios | Review Set | | board H | ighlights 🗸 | | |
|---|-----------------------------------|-----------------------|-------------|-----------------------------------|---------------|---|
| = <mark>(</mark>]) Earth - (]) Ourro | ent (V7) | Тор | 10 most det | eriorated artefacts | ~ = | High cloning - recent cl 🗸 |

Тір

When a filter is applied, you can select a dynamic highlight category called **Currently Fitered Artefacts**. This highlight displays a simple list of artefacts that match the filter that you can add to your review set or export to a CSV file.

Let's now build a highlight from scratch that uses the same filters and displays more information about the artefacts. Click the hamburger menu next to the list of highlight categories and select **Add Definition**. The popup that opens lets you configure the data columns to display for each artefact, as well as apply filters the same way you did in the Filter Panel:

| Highlights Definition | |
|-------------------------------|--------------------------------------|
| | |
| Name*: | Mofidied Artefacts with High Cloning |
| Target Artefact Types*: | File (Alias) × Function (Alias) × |
| Max results number*: | ¢ |

Version : 18.0.18 Date : 27/09/2019

The values in the popup above reproduce conditions of the filter you used earlier:

- It applies to file and function artefacts (Target Artefact Types)
- → It displays all results with no limit (Max results number)
- → It defines two filter conditions
 - → The measure Code Stability Index is lower than 100% (i.e.: the artefact was modified)
 - → The measure Cloned Code is higher than 0 (i.e.: there is some cloning)

Click **Add** to create the highlight and view the results. You can also clear the current filter, since the highlight category defines the same conditions.

| Dashl | board | Highlights | ~ | |

The extra columns for your new highlight category

Тір

When you save a highlight definition, you can decide to make it available for all projects that use the same analysis model, and make it public so other Squore users can use it.

5.2. How Do I Find and Keep Track of Artefacts?

For some projects, you may want to collect artefacts so you can review them later. Squore enables you to build a Review Set, a list containing artefacts that you want to keep track of. Let's log in as the demo user to review all the new artefacts added to a project, in order to evaluate their level of quality.

Isolating the new artefacts can be done in three steps:

- 1. Log in using the demo user (demo/demo).
- 2. Click on version V6 of **Earth** in the Project Portfolios to display the dashboard for the last version of the project.
- 3. Create a filter to display only items in the Evolution column with the status New and apply your changes

You should see the following artefacts in the Artefact Tree:

The new artefacts in the current version of Earth

Squore makes it easy for you to keep track of these artefacts. Click on the icon above the Artefact Tree and select **Add Filtered Results to Review Set**.

You can now clear your filter, the artefacts you want to review are stored in your Review Set. Click the **Review Set** tab in the left pane of the explorer to find the items you just saved.

The Review Set filled with new artefacts for version V6 of Earth

At any moment, the artefact currently selected in the Artefact Tree can be sent to the Review Set as well. Simply display the context menu for an artefact and click **Add to Review Set** to add it to the Review Set. Clicking an item in the Review Set pane has the same effect as clicking it in the Artefact Tree: the dashboard refreshes to show the information for that artefact. You can use the left and right arrows in the Review Set pane to go to the previous and next artefact in the list.

If you want to know more about what actions you can take after reviewing artefacts, refer to Chapter 6, *Managing Your To-Do List With Squore* and Chapter 10, *Communicating With Squore*.

5.3. How can I Understand and Enhance My Model?

Squore provides tools to understand, verify and enhance your model under the Models menu.

- → The Viewer, a graphical representation of all the analysis models on Squore Server
- → The Validator, a debug tool for model writers

Ref : SUM_Squore

Version : 18.0.18 Date : 27/09/2019 64

- → The Dashboard Editor, which allows customising the dashboards that all users will see
- → The Analysis Model Editor, which allows modifying the model's ruleset

Users whose profile grants the "View Models" permission have access to the first two tools.

Users whose profile grants the "Modify Models" permission have access to the last two tools.

5.3.1. Viewer

To use the Viewer:

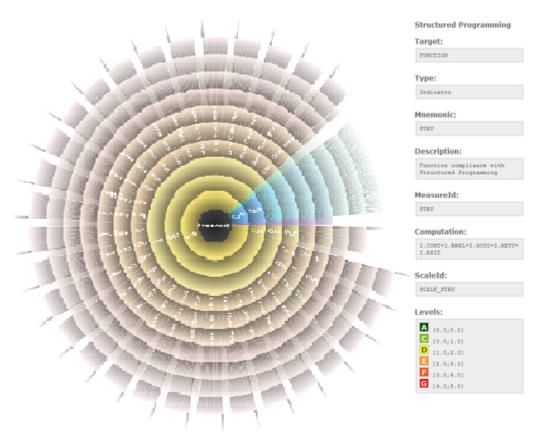

- 1. Click **Models > Viewer** in the toolbar.
- 2. Select the analysis model you want to browse.
- 3. Select the artefact level you want to browse.
- 4. Choose your preferred graphical representation between Space-Tree and Multi-level pie.
- 5. Select whether measures are displayed using their full name or their mnemonic.

Upon selecting the parameters above, the page is refreshed with the top-level indicators in the model, and you can click each indicator to unveil sub-indicators and their characteristics. You can drag the tree left and right to reveal all sub-levels if necessary. For each indicator selected, Squore displays the following information:

- → Target is the target artefact type for the selected item
- → **Type** is the type of the selected item
- → Mnemonic is the short code for the selected item
- → description is the description of the selected item
- → Data Provider is the Data Provider responsible for computing the selected item
- → MeasureId is the measure ID of the selected item
- → Computation is the formula used to compute the value of the selected item
- → ScaleId is ID of the scale associated with the selected item
- → Levels is the list of levels available for the selected item and their ranges

65

The Validator reporting errors

Your Squore administrator can help you get more information model development. You can also refer to the Squore Configuration Guide for a complete reference.

5.3.3. Dashboard Editor

The Dashboard Editor is a graphical editor for the dashboards of a particular model. Dashboards consist of a key performance indicator, a list of tables and one or more columns of predefined charts. With the Dashboard Editor, you can rearrange the information shown on the dashboard for all users, or create a completely new dashboard for a new role in your project.

In order to use the Dashboard Editor:

- 1. Click Models > Dashboard Editor
- 2. Select a model and load an existing dashboard

The current dashboard skeleton is loaded in the editor, as shown below:

67

Getting Started Guide

The right panel displays your current dashboard, where every chart can be resized or edited, while the left

The right panel displays your current dashboard, where every chart can be resized or edited, while the left panel allows you to add new charts or tables by dragging them to your current dashboard. When you are satisfied with your changes, you can save your modifications. You can also create a new dashboard, using an existing one as a basis for the new one, or start from a blank canvas.

Your changes are saved in Squore's workspace folder on the server and are made available to all other Squore users when you click **Save**.

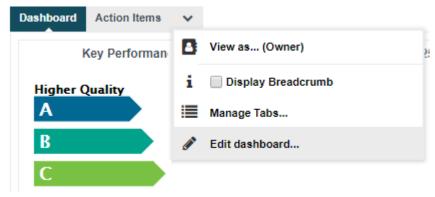

Тір

You can edit a dashboard directly from the Explorer by clicking the Edit Dashboard... entry in the Explorer Settings.

68

https://www.squoring.com/

The Edit Dashboard... menu loads the current dashboard in the editor so you can change it.

More detailed explanations about the Dashboard Editor can be found in Squore's Online Help.

5.3.4. Analysis Model Editor

The Analysis Model Editor is a graphical ruleset editor where you can turn rules on and off, or adjust the categories associated to each rule in your model.

It also allows you to save ruleset templates so that you can use a different set of rules for each project you create

In order to use the Analysis Model Editor:

- 1. Click Models > Analysis Model Editor
- 2. Select a model to load its ruleset

The entire ruleset for the current model is displayed in table form, as shown below:

:::::: SQUORE

The Analysis Model Editor displaying the ruleset of the Software Analytics model

Use the filter pane and the table headers to find the rule you want to modify. You can activate or deactivate a rule by clicking the on/off switch in the table. If you want to make more modifications, cick the **Edit** icon for this rule.

You can edit multiple rules at once by checking several rules and using the actions list at the bottom of the page. When you save your changes, the configuration is reloaded and every new analysis for this model will use the new settings.

Тір

Changes made in the web interface are saved in a workspace folder on the server.

5.3.5. Using Ruleset Templates

Using the Analysis Model Editor, you can set up various ruleset templates to modify or ignore rules that do not apply for certain departments or project teams within your organisation.

Users with model edition privileges (see the **Modify Models** permission in Section 3.1.1, "User Profiles") can define templates right from the Analysis Model Editor. Project managers can decide to modify existing templates or create new ones from the project wizard. In order to ensure that projects are analysed using company-wide standards, templates can be marked as approved, which prevents them from being modified by other users.

In order to create a ruleset template:

1. Click on Models > Analysis Model Editor

70

2. Select an analysis model and locate the **Template** selection list above the filter tools. For a model where no templates exist yet, only the **Duplicate As** button is available so can can create a new template from the default one.

| ŧ | Software Analytics (software_analyti 🔻 | | Save Cancel Delete Export | Import |
|-------|--|-----------|--|--------|
| Templ | late: (Default Template) | v | Duplicate As | |
| | The ruleset temp | plate too | ols for a model with no custom templates yet | |

3. Click **Duplicate As** to create a new template and enter edit mode. In this example, we are creating a ruleset that contains only rules that apply to the Python programming language. By checking the **Approved** box, we are defining this ruleset template as read-only for project managers.

| ŧ | Software Analy | tics (software_analyti 🔻 | Save | Cancel | | Export | Import |
|------|--------------------|--------------------------|----------------|--------------------|--------|--------|--------|
| Temp | late: (Default Ter | mplate) | • I Dupli | | | | |
| Nam | e of the template | python-rules | | 0 | | | |
| | Approved | | | 0 | | | |
| | | Creating | g a new python | -rules ruleset tem | iplate | | |

4. Activate, deactivate or modify any rule you want for the template. In this example, we use the filter tools to select all Data Providers, turn off all the rules, and then select the Python-related Data Providers to activate all their rules

71

The template selection in the project wizard

Тір

Templates can also be applied to projects from the command line using the --rulesetTemplate parameter:

--rulesetTemplate="python-rules"

5.3.6. Managing Ruleset Templates

Export and Import

Aside from creating and deleting ruleset templates, the Analysis Model Editor also allows you to export them to XML and import them again. This is useful if you want to copy your templates to another Squore Server or back them up before resetting your server.

| ŧ | Software Analytics (software_anal) v | | | | Delete | Export | Import |
|------|--------------------------------------|---|----------|------|--------|--------|--------|
| Temp | ate: python-rules (Approved) | ~ | Duplicat | e As | | | |
| Nam | e of the template python-rules | | 6 | | | | |

The Export / Import tools in the Analysis Model Editor

The exported XML file contains the entire ruleset.

Editing the XML template file manually before importing it as a new template is not recommended, however it can be useful so you can modify it to determine what happens to the rules not contained in the XML, using the disableOtherRules attribute.

| xml version="1.0" encoding="UTF-8"? | |
|---|---------------|
| <updaterules disableotherrules="false"></updaterules> | |
| This file is auto-generated, please don't modify | |
| <updaterule <="" disabled="false" measureid="R_MISRA_SAME_DEFPARAMS" th=""><th></th></updaterule> | |
| categories="SCALE_SEVERITY.MINOR;SCALE_NATURE.NON_CONFORMITY;CHARACTERISTIC.PORT | ABILITY;SCALE |
| > | |
| | |
| | |

Setting disableOtherRules to true deactivates all the other rules in the model that are not specified in the template. By default, or if the attribute is not specified, its value is set to **false**.

Handling Model Upgrades

Your existing templates will be retained when you upgrade your model to add new rules or upgrade to a new version of Squore:

- → Existing templates will have all the new rules as disabled (off) by default
- → The default template will have all the new rules as enabled (on) by default
- Projects analysed using project-specific templates (i.e. not using a saved template in the Analysis Model Editor) will have all the new rules as enabled (on) by default

5.4. Reviewing Multiple Projects

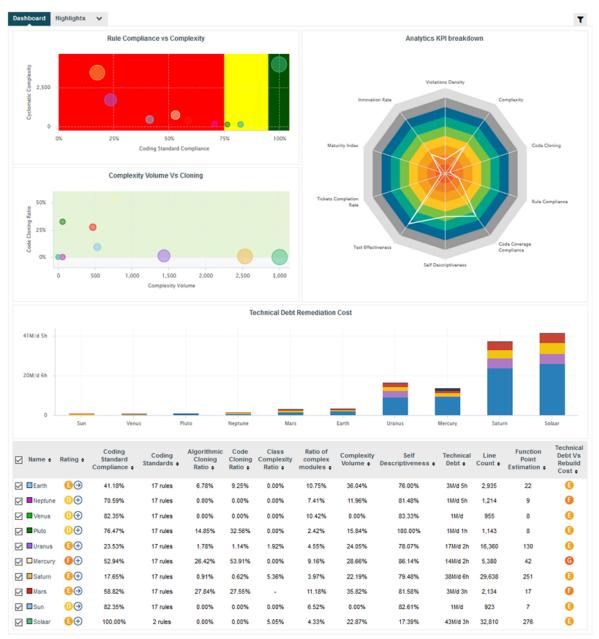

Project Managers may be interested in monitoring several projects as a whole. Squore provides a special dashboard view which compounds information about several projects into an Model/Group Dashboard, which can help you prioritise projects according to their current status.

In order to view the Model/Group Dashboard:

- 1. Log into Squore with the demo user.
- 2. Click the model name "Software Analytics" in the Project Portfolios.

The dashboard refreshes to show the compounded information for all projects analysed with this model using charts and a summary table of the main indicators, the rating and the trend of each projects.

Getting Started Guide

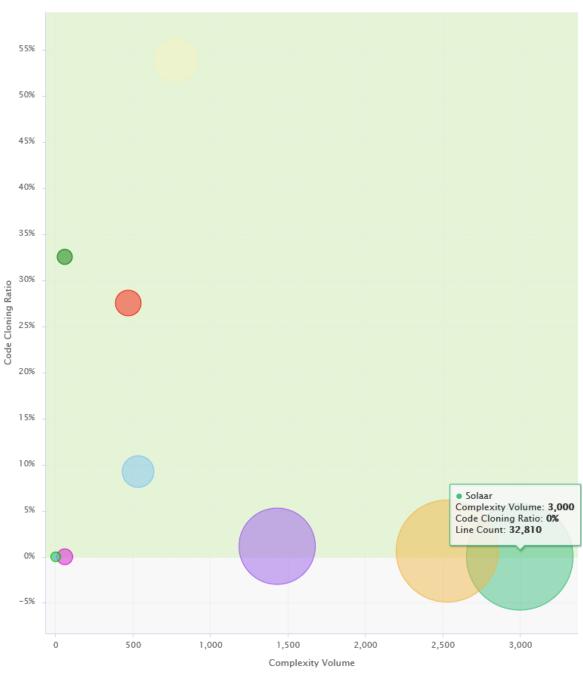

The Model/Group Dashboard for Software Analytics projects

In the quadrants, each project is represented as a bubble. Two indicators define the horizontal and vertical position of the bubble along the axes, while a third indicator defines the bubble size. Let's see how you should prioritise maintanance work on the your project portfolio for the sample projects. Click on the **Complexity Volume Vs Cloning** quadrant to view the full version:

75

https://www.squoring.com/

Complexity Volume Vs Cloning for current Software Analytics projects

In this chart, projects with a high code cloning ratio appear higher, while more complex projects appear more to the right. The size of each bubble indicates the size of the project in terms of source lines of code. Therefore, it may be easier to improve the quality of a project with a more cloning but less complexity like Pluto (dark green) than a project with less cloning but more complexity (Mars, in red) As a project manager, you know that as a general rule you need to focus on moving projects towards the bottom-left corner of the chart for a healthy portfolio of projects.

76

https://www.squoring.com/

Below the quadrants, Squore displays tables with the values used in the charts so you can refine the information read in the charts. All the information shown in the analysis model dashboard can be configured by a Squore administrator. Refer to the Squore Configuration Guide for more information.

77

https://www.squoring.com/

6. Managing Your To-Do List With Squore

The analysis results you obtained by creating your first projects in Chapter 4, *Creating Projects and Versions* and observed in Chapter 5, *Understanding Analysis Results* can be drilled down further by looking at the other tabs available in the Explorer. In this chapter, you will learn how to use the information contained in Indicators, Measures, Findings and Action Items to better understand and reuse the information provided by Squore in your development workflow.

6.1. How do I understand and Improve My Ratings?

If you need more background information about the measures and indicators used in the charts and tables in the dashboard, the **Indicators**, **Measures** and **Findings** tabs can provide more details about the statistics recorded for the current artefact. Note that these tabs are not displayed by default. If you want to show them in Squore, click the Explorer Settings menu and then Manage Tabs to display the Tab Manager to enable these tabs, as shown below:

| Dashboard | Highlights | Findings | Forms | Comments | ~ | |
|-----------|------------|----------------|---------------|----------------------|----------|-------------------------|
| | | | | | i | Display Breadcrumb |
| | | | | | ≣ | Manage Tabs |
| | | | | | <i>.</i> | Edit dashboard |
| | The Ma | nage Tabs opti | on in the Exp | olorer Settings allo | ows to c | lisplay the Tab Manager |
| | | | | | | |
| | | | | | | |
| | | | Tab Ma | inager | > | |
| | | | √ Dashbo | oard | | |
| | | | Action | Items | | |
| | | | 🗸 Highligl | hts | | |
| | | | Finding | s | | |
| | | | Report | s | | |
| | | | Forms | | | |
| | | | Indicate | ors | | |
| | | | Measu | res | | |
| | | | Comme | ents | | |
| | | | | | | |

The Tab Manager allows to display tabs hidden by default by checking them. Note that not according to your configuration, some tabs may not be removeable

If you want to understand the scale used for a particular indicator, to see for example how close you are to moving up the rating scale, you can check the scale used for this indicator in the **Indicators** tab of the dashboard.

Log in and search for the artefact **DB5_backup.c** in the Neptune project, where the indicator **Maintainability Non-Conformity** is rated E. While this tells you about the current rating for this artefact, this does not tell you

78

Getting Started Guide

how to improve it. In order to learn how to improve this score, let's first take a look at the scale used for this indicator. Click the **Indicators** tab of the Explorer. The table of indicators opens, as shown below:

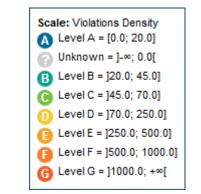

| Name 🔺 | Mnemonic 🖨 | Value 🛊 | Rank ¢ | Rating |
|------------------------------------|---|--------------|--------|--------|
| EVEL Non Compliant Functions | LEVLOUT | 0 | 0 | |
| laintainability Non-Conformity | WEIGHTED_NC_MAI_DENSITY | 472 Pts/KLoc | 0.25 | 0 |
| laintainability Risky Construction | WEIGHTED_RC_MAI_DENSITY | 581 Pts/KLoc | 0.5 | 0 |
| ICDC Code Coverage is disabled | RELAX_CODE_COVERAGE_MCDC | 0 | 0 | No |
| ICDC Cov. Goal Ratio | TCOV_MCDC_GOAL_RATIO | 0% | 1 | G |

| atio of complex modules | MODULES_CPXT_DENS | 0% | 0 | A |
| eliability | WEIGHTED_ISSUE_REL_DENSITY | 0 Pts/KLoc | 0 | A |
| eliability Non-Conformity | WEIGHTED_NC_REL_DENSITY | 0 Pts/KLoc | 0 | A |
| eliability Risky Construction | WEIGHTED_RC_REL_DENSITY | 0 Pts/KLoc | 0 | Δ |

The indicators table for DB5_backup.c

The table lists all the indicators available for the artefact over several pages. The scale and levels available for an indicator can be viewed in a tooltip by placing your mouse over a rating. Using the filter above the "name" column, look for the entry named **Maintainability Non-Conformity**, then click its value in the rating column. The scale for the indicator indicates that the artefact is rated E because the value of the indicator is 472.09. In order to improve the score, the value would need to decrease to under 250 to be rated D, as shown below:

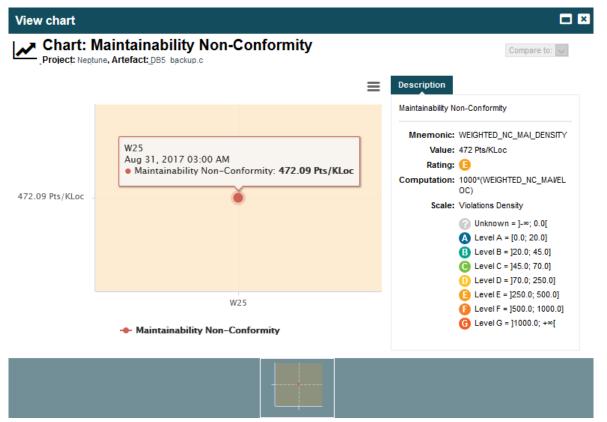

https://www.squoring.com/

The scale used for the Maintainability Non-Conformity indicator

To understand how to improve the rating, you need to know how the indicator's value is computed. Clicking the indicator name in the Indicator Tree shows the following explanation in the indicator popup:

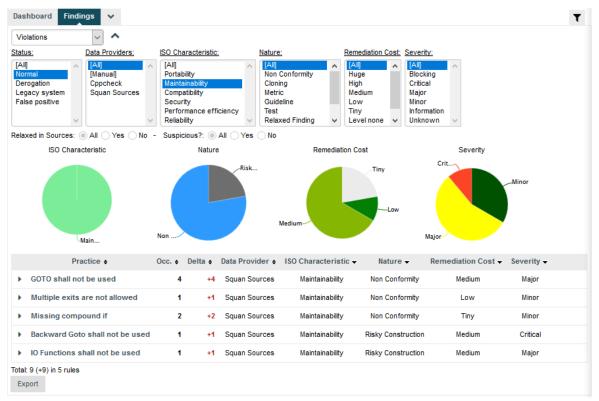

The indicator popup for the Maintainability Non-Conformity indicator

The computation, i.e. the formula used to calculate the rating is 1000*(WEIGHTED_NC_MAI/ELOC), meaning that the indicator computes a ratio of broken Maintainability rules. To find out what these rules are, click the **Findings** tab.

Squore displays all the findings for a particular artefact in a table in the Findings tab. Next to the finding's label is a number of occurrences followed by a colour-coded delta value (red for more occurrences, green for less) compared to a previous analysis.

If you want to find out which rules are taken into account by the Maintainability Non-Conformity indicator, expand the filter to show the advanced filtering options. Highlight **Maintainability** in the ISO Characteristics filter to see the corresponding rules, as shown in the picture below:

Tip

You can filter violations according to many criteria, including relaxation status, origin, artefact type and other characteristics from the analysis model

The rules **BWGOTO, STDIO, NOGOTO, RETURN and COMPOUNDIF** are the rules that should be fixed in order to improve the Maintainability rating of DB5_backup.c.

You can expand the **BWGOTO** rule to show each occurrence of the rule being broken, and also review the location in the source code that breaks the rule, as shown below:

81

https://www.squoring.com/

| | Practice ¢ | Occ. ¢ | Delta ÷ | Data Provider ¢ | ISO Characteristic v | Nature 🗸 | Remediation Cost • | Severity 🗸 | |
|--------------------------------------|---|--------|---------|--------------------|------------------------------------|-----------------------|----------------------------------|------------|--|
| Backw be use | ard Goto shall not d | 1 | +1 | Squan Sources | Maintainability | Risky Construction | Medium | Critical | |
| Mnemonic | Backward gotos shall not be used. Mnemonic: BWGOTO Characteristics: Stability, Changeability, Structured Programming, Testability | | | | | | | | |
| - | _scores_write() DB5_backup.c (Lir Backward Goto are | - | | opwrite) | | | | • | |

The location of the broken occurrences of the **BWGOTO** rule

Тір

The list of findings indicates if a finding is **New**, **Closed** or **Modified** since the reference version. Findings are traceable through time, so even if your code is modified, you can to go back to the version in which it was first detected.

Finally, clicking on the line number for each rule breaking occurrence opens the source code viewer in full screen so you can carry out your code review:

```
×
Sources
DB5_backup.c
በ

The source code viewer highlighting the first occurrence of BWGOTO

The source code viewer allows comparing the code against another version of the code. Select a version name in the **Compare to:** list to switch to diff mode, as shown below:

Version : 18.0.18 Date : 27/09/2019 83

https://www.squoring.com/

Getting Started Guide

The source code viewer in diff mode

Тір

In diff mode, use the top arrows to switch the left and right panes, and the bottom arrows to turn synchronised scrolling on or off. Characters that were removed are underlined in green, while characters that were added are underlined in red.

Analysing findings helps improving the quality of the code in your project. There is much more you can do with the Findings tab by using the built-in filters to detect regressions and improvements:

- > Violations: displays all the rules violated in this version
- → Lost Practices: displays violations that are new in this version since a specified version
- Acquired Practices: displays all violations not occurring anymore in this version since a previous version
- Deteriorated Practices: displays all violations with more occurrences in this version than in a previous version
- Improved Practices: displays all violations with less occurrences in this version than in a previous version
- New violations: displays all the new violations since a previous version
- → **Fixed violations:** displays all the violations fixed since a previous version
- All changed violations: displays all the rules where a change in the number of violations was detected, essentially providing the combination of New violations and Fixed violations in one list
- → All rules: displays all the rules checked by the model, i.e. the violated ones as well as the ones that are not

Тір

By default, the Findings tab displays violations compared to the previous analysis, but you can refine the search by adjusting the **Reference** drop-down list (under the Explorer Settings menu) that contains all the versions analysed in your project.

You can learn about more automated ways to review and fix code in Section 6.9, "How Do I Review And Manage Action Items Flagged by Squore?".

You can click the **Export** button at the bottom of the list of findings, to generate a CSV file of the findings displayed in the user interface. The contents of the file reflect your current filter selections on the page. The following is a CSV export for the Findings of the Earth project, which you can download in full here [https://wiki.squoring.com/display/HOW/Sample+Reports+and+Exports?preview=/3637365/3637370/findings.csv].

A CSV export of the findings of the Earth project

Note

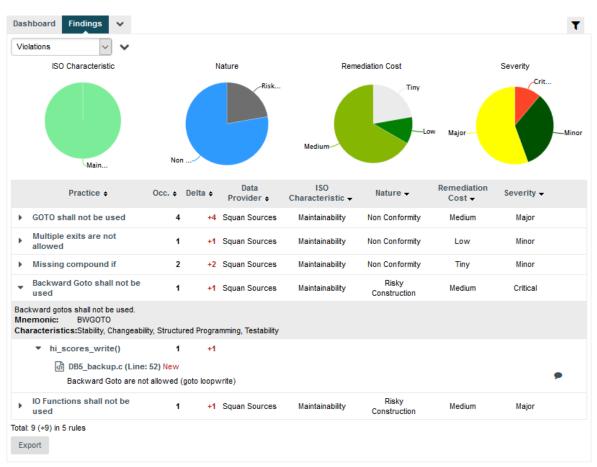

If the Export button is greyed out, your licence does not include the option to export data to CSV files.

6.2. Relaxing Findings

If you realise that a violation found during an analysis is not justified, you can relax it from the Findings tab of the Explorer.

In the example below, a we consider that a **Backward goto** violation should not be reported, because it is a false positive. Let's start by locating the violation in the Findings tab:

Getting Started Guide

The backward goto violation we want to relax

When you hover over the menu icon for the violation, you can display a context menu that allows you to change the status of the finding:

| 😚 Change Status | |
|--------------------------|--|
| The finding context menu | |

Click Change Status... to view the available statuses for the violation.

86

https://www.squoring.com/

| Change Status | | |
|---------------------------|---|-----|
| Change status of 1 findin | igs: | |
| Status | False positive | ~ |
| Childo | Select a status | |
| | Normal | |
| | Derogation | |
| | False positive | |
| | Legacy system | |
| Comment * | Confirmed in team meeting as false positive | |
| | | |
| | | |
| | | .:: |
| | Change | |
| | | |

The Change Status Popup

Type a justification or comment for the relaxation and choose from one of the reasons for relaxing the violation:

- → Normal is the default status for new findings, which means no relaxation
- → Derogation means that you are relaxing a true violation for an exceptional reason
- → False positive can be used to work around a violation that was falsely detected by a data provider
- Legacy system is used when a violation is detected in a piece of code that was analysed but cannot or will not be fixed.

In our example, select **False Positive**, enter a comment and click **Change**. The Findings page will reload and the violation will be gone from the list.

Getting Started Guide

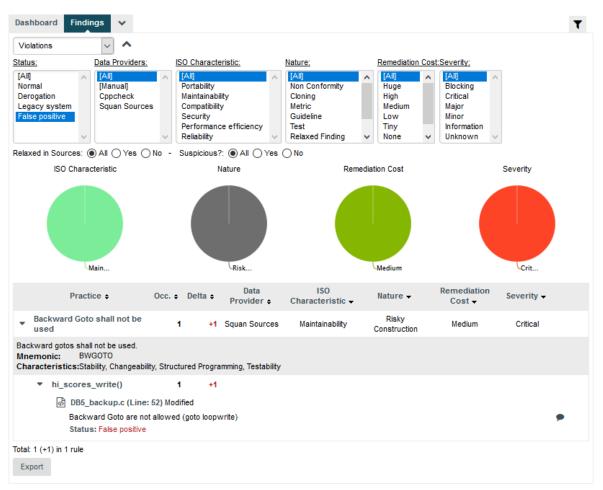

The updated findings list after relaxing the backwards goto

Relaxed findings are never deleted. If you want to review the list of findings that were relaxed in your project, adjust the filter on the Findings tab to display relaxed findings, as shown below;

88

https://www.squoring.com/

Getting Started Guide

The filtered list of findings for the project, including the backwards goto false positive

Тір

You can relax an individual finding, all findings for an artefact, or an entire rule at once. Note that instead of relaxing a rule, you can deactivate rules by using the Analysis Model Editor (see Section 5.3.4, "Analysis Model Editor").

If you are looking to relax entire artefacts instead of findings, you can do that from the Artefact Tree, as described in Section 6.5, "Relaxing and Excluding Artefacts").

6.3. Relaxing Violations in Code

Squore provides a violation relaxation mechanism that is triggered via comments found in the source code itself. There are two pre-requisites for relaxation to work:

- The model used to analyse your source code must implement a special rule called R_RELAX for relaxation to take place.
- You need to know the mnemonic of the violated rule you want to relax, in order to use it as a key in your comment.

Squore interprets comments formatted in one of these three ways:

89

1. Inline Relaxation

This syntax is used to relax violations on the current line.

```
some code; /* %RELAX<keys> : Text to justify the relaxation */
```

2. Relax Next Line

This syntax is used to relax a violation on the first following line that is not a comment. In the example the text of the justification will be: "Text to justify the relaxation the text of the justification continues while lines are made of comments only"

/* >RELAX<keys> : Text to justify the relaxation */
/* the text of the justification continues while */
/* lines are made of comments only */
some code;

3. Block Relaxation

This syntax is used to relax violations in an entire block of code.

```
/* {{ RELAX<keys> : Text to justify the relaxation */
/* like for format 2 text can be on more than one line */
int my_func() {
    /* contains many violations */
    ...
}
/* }} RELAX<keys> */
```

<keys> can be one of the following:

- → <*>: relax all violations
- → <MNEMO>: relax violations of the rule MNEMO
- Sector Sector

The relaxed violations are still shown in the Findings page after the next analysis, but they appear under the rule R_RELAX, showing the mnemonic of the relaxed violation and the justification text.

As an example, this is how you would relax the violations of the rule Backward goto for Maintainability Non-Conformity in Neptune:

1. click the violation of **Backward goto** on the Findings page to find the rule's mnemonic (BWGOTO) and the location of the finding (DB5_backup.c line 52).

The details of the Backward goto violation

2. Edit the code of the sample project to relax the violation as shown below.

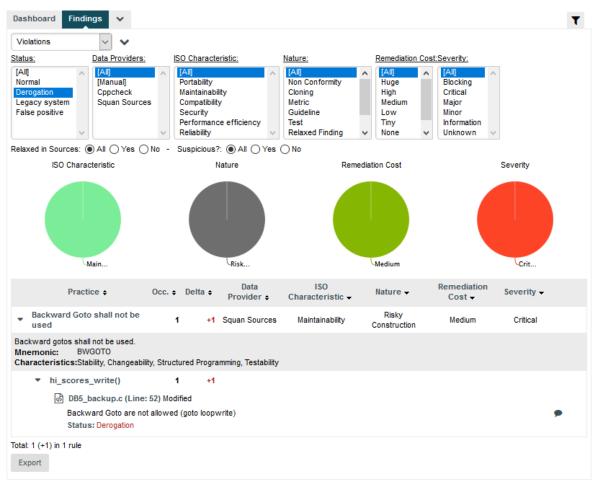

```
goto loopwrite; /* %RELAX<BWGOTO> : This backward goto is acceptable in our
code. */
```

90

3. Create a new version of the project.

On the Findings page, the violation now visible if you select to display derogations in the filter:

The relaxed violation is visible when displaying derogations

Тір

Using the **Relaxed in Sources** toggle in the filter options, you can choose to show or hide violations that were relaxed in source code (new in 18.0).

6.4. Suspicious Findings

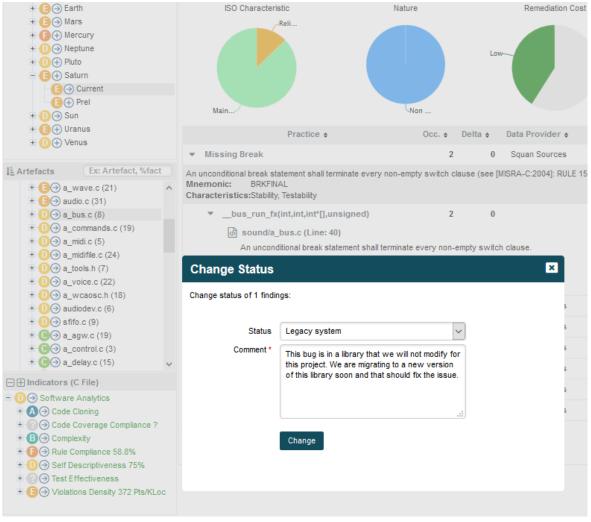

After you have relaxed findings, Squore will check for source code changes around the location of the relaxation and will alert you if a relaxed finding should be re-examined by flagging it as suspicious (new in 18.0). The suspicious state is a flag that is automatically added to relaxed finding and does not affect their relaxation state.

There are 12 suspicious findings, click here to review them.

The warning banner for projects containing suspicious findings

Getting Started Guide

To see suspicious findings in action, we will relax the Missing Break at line 40 in $audio/a_bus.c$ in the project called **Saturn**. Click the Current node in the portfolio, find the artefact in the project and enter a relaxation comment for the Missing Break at line 40:

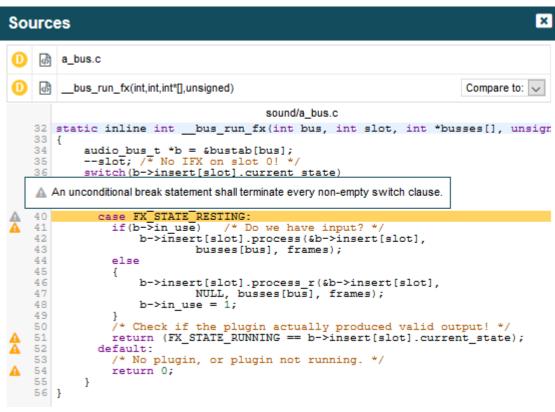

Relaxing the Missing Break at line 40

When saving the finding relaxation, the source code viewer changes the marker for the finding to a grey warning sign (new in 18.0) to indicate that the violation was relaxed.

92

https://www.squoring.com/

Grey and yellow markers in the source code viewer for relaxed and normal findings

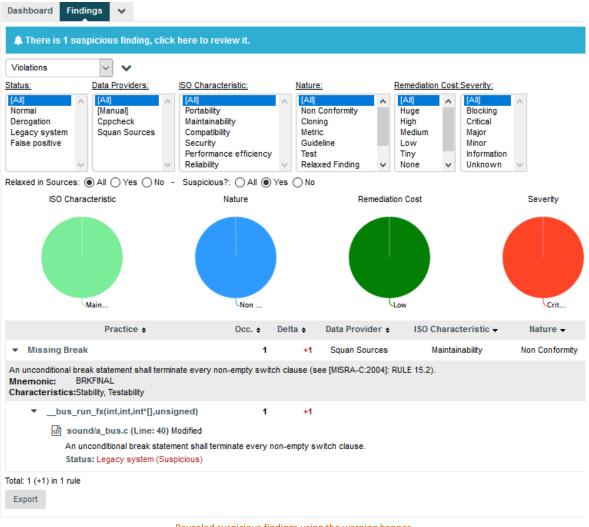

The next version of the file included in the library does not seem to include any fix for the specific violation, but instead uses a renamed variable in the artefact where the finding is:

```
static inline int __bus_run_fx(int bus, int in_slot, int *busses[], unsigned
 frames)
audio_bus_t *b = &bustab[bus];
 --in_slot; /* No IFX on in_slot 0! */
 switch(b->insert[in_slot].current_state)
 ł
  case FX STATE RUNNING:
   case FX_STATE_SILENT:
   case FX_STATE_RESTING:
  if(b->in_use) /* Do we have input? */
  b->insert[in_slot].process(&b->insert[in_slot],
     busses[bus], frames);
  else
  b->insert[in_slot].process_r(&b->insert[in_slot],
    NULL, busses[bus], frames);
  b \rightarrow in_use = 1;
  /* Check if the plugin actually produced valid output! */
  return (FX STATE RUNNING == b->insert[in slot].current state);
  default:
  /* No plugin, or plugin not running. */
  return 0;
```

} }

Since the relaxed violation is still there, analysing this code triggers the suspicious finding warning in the web interface to alert you in case you need to revise the finding status now that the code has changed. Click the banner to reveal the suspicious finding, as shown below:

Revealed suspicious findings using the warning banner

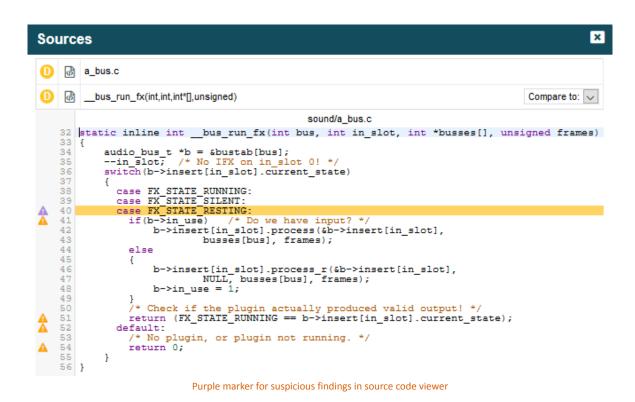

Тір

Clicking the banner automatically applies a filter that lets you view the suspicious findings, but you can also set up this filter manually using the **Suspicious?** option on the Findings tab (new in 18.0).

Note that the violation is still relaxed with the **Legacy System** status, but the **Suspicious** flag was attached to it. Click the source code icon next to the finding to view the source code in this new version. The marker for the finding is now purple, which is the colour used to highlight suspicious findings (new in 18.0):

94

After reviewing the finding, you can remove the suspicious flag by opening the **Change Status...** dialog again and change the relaxation status or comment, or just remove the suspicious flag:

95

https://www.squoring.com/

Change Status

Change status of 1 findings:

· demo on Apr 1, 2018 7:42 PM (Legacy system) - with suspicious state:

This bug is in a library that we will not modify for this project. We are migrating to a new version of this library soon and that should fix the issue.

· demo on Apr 1, 2018 7:24 PM (Legacy system):

This bug is in a library that we will not modify for this project. We are migrating to a new version of this library soon and that should fix the issue.

| Status | Legacy system |
|--------------------------|---|
| Remove suspicious state. | |
| Comment * | The updated library does not fix the bug. No further action considered at the moment to avoid any stability impact. |
| | Change |

Removing the suspicious flag of a finding

When you save your changes, the suspicious warning banner disappears, as there are no more suspicious findings to review in the project.

Note

Detection of suspicious findings is activated by default and is a parameter of Squan Sources that can be tweaked by modifying the following parameters in the project wizard:

Mark relaxed findings as suspicious

is 🔿 Never

When code changes before finding location

O When code changes anywhere in the artefact

The settings for suspicious finding detection in Squan Sources

6.5. Relaxing and Excluding Artefacts

In this section, you will learn how to relax or exclude entire artefacts directly from the Artefact Tree instead of relaxing findings. Relaxing artefacts ensures that their metrics do not impact the rating of the project, however, data providers will still generate findings for the relaxed artefacts. Excluding artefacts hides them from the project, and findings and action items are no longer created for them.

96

https://www.squoring.com/

This example uses the Mars project from the samples folder. Ensure that you are a Project Manager in this project, or are part of a role with the **View Drafts of Projects** and **Modify Artefacts** privileges before you begin.

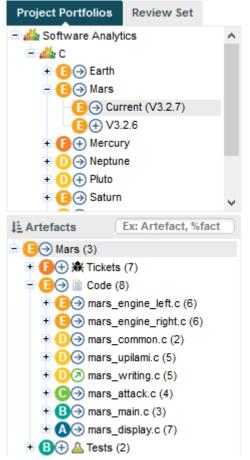

Tip

The Mars is a sample project that includes ticket and test artefacts, in addition to the source code artefacts you have encountered up to this point. For more information about projects containing artefact types other than source code, refer to Chapter 7, *Going Beyond Source Code*.

Expand the Project Portfolios to show all the versions of **Mars**. There are two versions in the tree (from bottom to top):

- 1. **V3.2.6** is the baseline version, whose results were computed during the analysis and cannot be changed.
- 2. **V3.2.7** is a version that analysed as a draft so that you can edit form values, relax, exclude ot add artefacts in preparation for the next analysis, as described in Section 4.3, "Working with Draft and Baseline Versions".

Click on Mars > V3.2.7 to see the artefacts in the Mars project as created by the demo script:

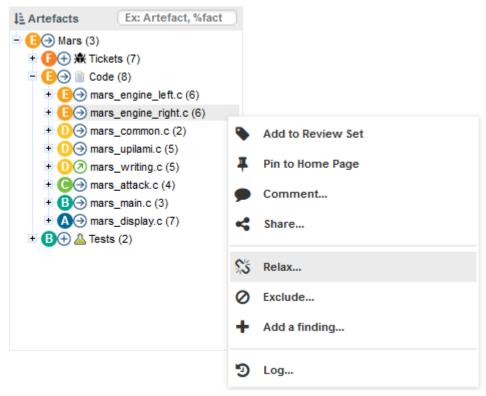

The artefacts in the V3.2.7 version of the Mars project and their rating

To relax an artefact and therefore tell Squore that its rating should not impact the rest of the project, display the context menu for this artefact. The relaxation options appear at the bottom of the menu if they are available for your model, as shown below:

97

https://www.squoring.com/

The artefact context menu

There are two actions that can be taken to relax an artefact:

- → Relax... allows simply marking an artefact as relaxed, leaves it in the tree in a way that will not impact the overall rating of the project.
- → Exclude... also relaxes the artefact but then removes it from the Artefact Tree so it will not be visible anymore in future analyses.

Tip

In both cases, the relaxation action is only made on a draft version and can be reversed by selecting the **Un-relax...** entry in the menu or the **Clear unapplied changes** option in the project portfolio.

Clicking **Relax...** or **Exclude...** brings up a pop-up menu where you can type a comment to explain the reason for the relaxation. Let's relax mars_common.c so it stops impacting the overall project rating. Click the **Relax...** option in the menu to display the relaxation popup and enter a relaxation comment:

98

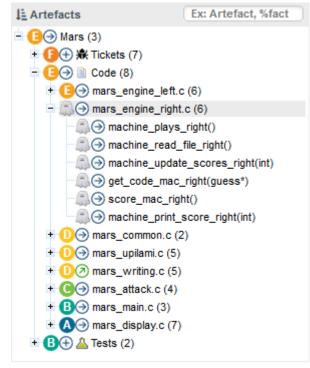

https://www.squoring.com/

| Relay | ation | × |
|--------|---|---|
| User: | demo | |
| | This file contains legacy code that does not follow our new coding conventions. It is analysed in a different project with a different ruleset, and therefore can be relaxed here so it does not impact our rating. | |
| Commer | t undere fore can be relaxed here so it does not impact our rating. | |
| | | |
| | Confirm | |
| | | |

The relaxation justification

Click **Confirm** to save your comment, and notice how the Artefact Tree is updated to reflect the finding's status:

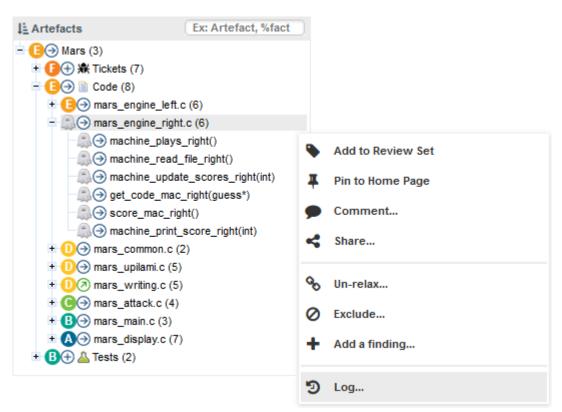

The relaxed mars_common.c in the Artefact Tree

Other users can review the justification for the relaxation by clicking on the Log... item in the artefact context menu:

99

The log of changes for the artefact mars_common.c

If you keep relaxing artefacts in this project and create a new draft build of the project, then you will end up seeing changes in the overall rating,

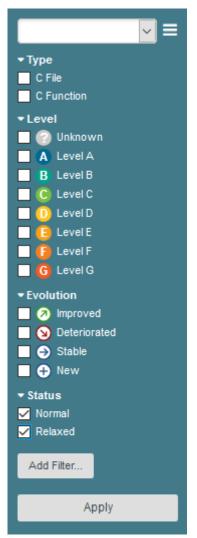

Тір

When you relax an artefact, the action items and findings relevant to this artefact are hidden, except when you specifically click on the relaxed artefact. , you can do so by clicking the option from the Explorer Settings menu. If you want to show them, you can create a filter that includes relaxed artefacts by checking the boxes with the appropriate status in the Filter Panel:

100

https://www.squoring.com/

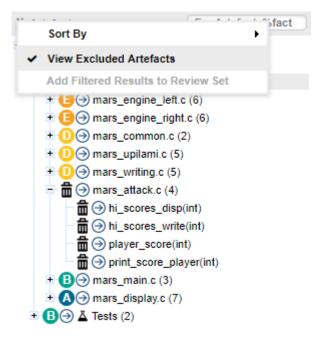

The artefact statuses shown by default in the Artefact Tree

Excluded artefacts can be shown or hidden by clicking the View Excluded Artefacts menu option in the Artefact Tree

101

The View Excluded Artefacts menu option in the Artefact Tree

6.6. Adding Findings Manually

If you notice that a violation in the code or an issue in the project was not detected during an analysis, you can decide to create a finding manually from the Artefact Tree.

Note

This feature, like the creation of manual artefacts (see Section 10.3, "Adding and Removing Artefacts Manually") is only available if your model was configured to support it. Consult your Squore administrator to verify if it is available in your configuration.

In this example, we add a finding to notify of a documentation issue in the Neptune project. Click on the Current version of the project, and display the context menu for the artefact where you consider that the documentation is wrong.

102

| Project Portfolios | Review Set | | | |
|--|------------|-----------------|-------------|-------------------|
| + € → Earth + E → Mars + F → Mercury - D → Neptune D → Veptune D → Vurn D → W25 + D → Pluto + E → Saturn + D → Sun + E → Uranus + D → Venus | ent | | ~ | |

6.7. Working with Forms and Checklists

Squore lets you view and edit project attributes in a dedicated form tab of the explorer. You can therefore design your wizards to present checklists to a user. They can fill in the values manually after an analysis and

105

https://www.squoring.com/

they will be taken into account when creating the next version of the project. There are permissions associated with editing form values, so you can make them read-only for guests but read-write for project managers. The attributes displayed on the Forms tab depend on the type of the current artefact, and values are saved individually for each artefact in the project.

Note

To begin working with forms, make sure you select the Current version of the project in the tree and that the **Forms** tab is visible in the Explorer.

When you click a project in the Project Portfolios and view the Forms tab of the Explorer, all the project attributes available at application level are displayed, as shown below:

| ashboard Forms 🗸 | | | • |

| | | | |

The Forms tab for the Neptune project at application level

The values displayed correspond to the application attributes passed when the last version of Neptune was created. Users with the whose role grants them the Modify Artefacts Attributes privilege can edit the current value of the form for any artefact, and the value will be taken into account during the next analysis.

When you modify the values in the form, you can use the comment field to justify the change you made. A history of the modifications can be displayed by expanding the attribute field, as shown below

106

A history of modifications for the Test Coverage attributes

6.8. What Does This Measure Mean Exactly?

If you have doubts about the measures computed by Squore and their meaning, they can usually be solved by looking at the **Measures** tab of the Explorer. The content of the measures tab is also always refreshed to reflect the data for the current artefact, and is organised in a table displaying the measure's mnemonic, full name, description and value for the current selection, as shown in the picture below.

| Name 🔺 | Mnemonic 🔺 | Value ¢ | Data Provider 🜩 | Status ¢ | | | | | | | |
|--|-----------------------|---------|-----------------|---------------|--|--|--|--|--|--|--|
| Software Analytics | ANALYTICS | 0.53 | | Ok | | | | | | | |

| Number of Classes | CLASSES | 10 | | Ok | | | | | | | |
| Class Complexity Ratio | CLASSES_CPXT_DENS | 0% | | Ok | | | | | | | |
| Code Cloning | CLO | 1 | | Ok | | | | | | | |

The table of measures for the DB5_backup.c

Measures can be sorted by mnemonic, name, description or value, and the sorting value is remembered when selecting another artefact in the tree so you can easily compare values.

107

https://www.squoring.com/

The table also tells you which Data Provider reported the metric and its status in the latest analysis, so you can determine if a metric was computed or has its default value from the analysis model. The possible status values are:

- → Default Value: This measure has the default value defined in the analysis model
- → **Ok:** A value was computed successfully for this measure
- Jser-defined: The value was set by the user (either via a tag on the command line or in the Forms tab of the web UI)
- Definition error: The value could be computed because of an error in the analysis model. Check the Model Validator to learn more.
- Incomplete: The value could not be computed because of an error (maybe a division by zero?). The analysis model should probably be updated to avoid this in the future. This error is also available in the project's build.log.
- Warning: The value could not be computed, but there is nothing wrong with the measure definition in the analysis model. Maybe you are trying to do a COUNT on descendants but there are no descendants? In such cases, the error is not serious, but you can improve your analysis model to handle the warning if needed.
- -> -: This measure was not found in the project. It did not exist at the time of the analysis.
- → **Unknown:** An unexpected error happened computing the measure's status

Note

In all error statuses above, the metric is assigned the default value defined in the analysis model.

6.9. How Do I Review And Manage Action Items Flagged by Squore?

Searching for issues in your applications can be a manual process, as explained in Section 6.1, "How do I understand and Improve My Ratings?", but the analysis and decision models configured within Squore can automate this process by automatically suggesting items that require your attention after analysing the latest version of your code. This functionality can be accessed as part of the Explorer, in the **Action Items** tab. In this section, you will learn how to review Squore's suggestions and incorporate them into your own issue management tool.

Note that in order to change the status of action item, you must be working with the current draft version of a project. In order to follow the steps below, ensure that you select the current version of the Earth project, click on the Action Items tab. A list of action items suggested by Squore appears in a table, as shown in the picture below:

108

https://www.squoring.com/

The action items table for the current version of the Earth project

You can filter action items if needed by using the filters above the table. The name given by Squore to the action item is the name defined in your analysis model for this alert. Priorities are also predefined, and your input is needed to validate or invalidate the reports based on your priorities.

In the action items list, 112 is critical, therefore its status should be changed to **Todo**.

If you are unsure about a report, you can click the action item ID to display the full details, which includes the location(s) in the source code that triggered the alert:

| | | | | | | | | | | |

Action Item details for 8

You can review the code in a popup window before you decide to fix or relax the action item.

Finally, you can export the action items generated by Squore and feed them into your own issue tracker: Select the export format you want to use (CSV, ClearQuest, Mantis, XML, or any other custom format you defined in your configuration) and click the **Export** button to download the list to a file. You can also add all artefacts that triggered an action item to your Review Set by clicking the appropriate button.

110

Note

If the Export button is greyed out, your licence does not include the option to export data to CSV files.

Tip

If you are looking for a way to present action items instead of exporting them, you should look into Squore reporting functionality, described in Section 10.4, "Reporting Project Status"

6.10. Can I Perform Advanced Data Mining?

The Capitalisation base provides statistics aggregates, distribution graphics and correlation coefficients across a portfolio of projects. To begin using the Capitalisation to understand historical trends about your projects and find out if your analysis models are suited to your development style, click the **Capitalisation** menu item in the Squore toolbar.

| Portf | olio Statistics Aggregate | s Distribution Corr | elation | | | | |

The Capitalisation Projects tab

In the projects tab, choose the projects that will be used to aggregate statistics. In the example below, we will look at statistics for the Earth and Mars projects, which both use the same analysis model and have similar overall ratings. Select Earth and Mars from the list and click the **Statistics Aggregates**.

The Statistics Aggregates tab offers an overview of all your projects' data by providing minimum, maximum, average, number of occurrences, deviation, mod, sum and median results. Results are based on all the measures of an artefact type. This means that you have to specify an artefact type before any data is displayed.

111

The Capitalisation Base Statistics Aggregates at Application level

The Distribution tab offers the possibility to display any kind of distribution. The distribution is based on a measure of an artifact type. As a result, you have to select both an **Artefact type** and a **Measure** before you see any results. Note that you can change the parameters of the distribution graph by adjusting the number of bars, and the minimum and maximum values for the axes. The picture below shows the distribution of lines of code (a measure called LC) across all artefacts of type FILE for Mars and Earth.

112

https://www.squoring.com/

Getting Started Guide

The Capitalisation Base Distribution Graph for lines of code per file

The Correlation tab displays the matrix of correlation of any data stored in the Squore database. Correlations are computed between artefacts of the same type, so you have to select the artefact type before any data is displayed. Squore highlights cells in the table in which correlations are above the threshold defined by moving the slider or entering a correlation coefficient directly in the text box provided. You can choose to include derived data by checking the box above the matrix table.

The Capitalisation Base correlation table for files measures with a highlighting threshold of 0.8

Тір

Base measures are the ones directly reported by various tools included in the analysis. Derived measures are metrics computed based on these base measures or other derived measures.

You can choose to export the results of the correlation matrix to a CSV file. The resulting CSV file contains all metrics pairs for which a correlation exists.

Note

If the **Export** button is greyed out, your licence does not include the option to export data to CSV files.

7. Going Beyond Source Code

Squore allows incorporating more than source code in your projects. Software Analytics, the default analysis model and has built-in support for importing tickets related to your development project, as well as results from your test campaigns (new in 18.0).

The Mars project is an example of a C development project that also allows you to track the progress of tests and tasks using the **Test Effectiveness**, **Code Coverage Compliance**, **Innovation Rate** and **Tickets Completion Rate** indicators.

Ticket, test and source code artefacts in the Mars and the score card for a source code file

Version : 18.0.18 Date : 27/09/2019 116

https://www.squoring.com/

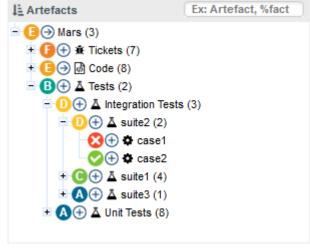

This chapter describes how to understand these indicators using the charts and highlight categories in the Software Analytics model and shows you how to use the available Data Providers to import test and ticket data into your own Squore projects.

7.1. Test Management

The Test Effectiveness indicator is based on a ratio of passed and failed tests in your project. It is enabled by default in your project if you use a Data Provider that imports test artefacts, like JUnit, VectorCAST, RTRT or MSTest.

The Code Coverage Compliance indicator is based on function coverage metrics imported by Data Providers like RTRT, JaCoCo, GCov or NCover among others.

In order to view test results, expand the **Tests** node in the Artefact Tree for the Mars and switch to the **Tester** dashboard, which provides information specific to the test results for your project.

Test artefacts in Mars

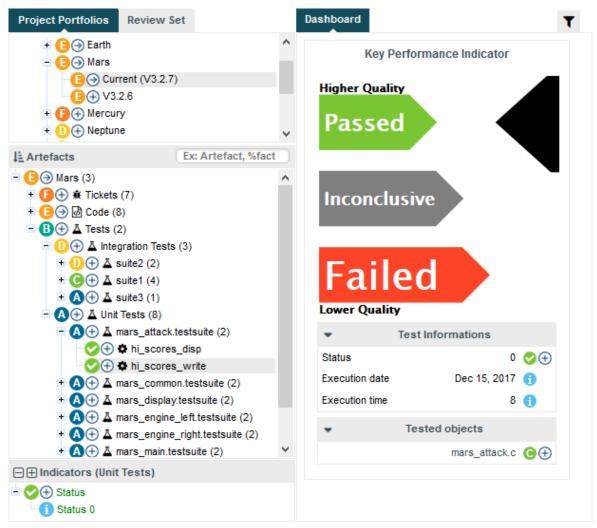

Expand the **Tests** node in the tree to uncover the hirarchy of tests. Each test is imported with its execution result, date and run time. The overall rating of the Tests node is the test effectiveness indicator, which also contributes to the overall project rating.

Clicking a test artefact displays a dashboard containing the test information, as well as a table containing links to the objects tested by the test, as shown below:

117

https://www.squoring.com/

Getting Started Guide

The dashboard for a test artefact

Clicking the link to the tested source code file brings up a dashboard showing the complete list of tests covering the source file, which are also clickable.

118

Links to tests in a dashboard for a source code file

You can click the root test node (or any test suite artefact) to get a history of test execution as well as a text execution matrix showing the test results of all test cases in the project.

119

https://www.squoring.com/

Getting Started Guide

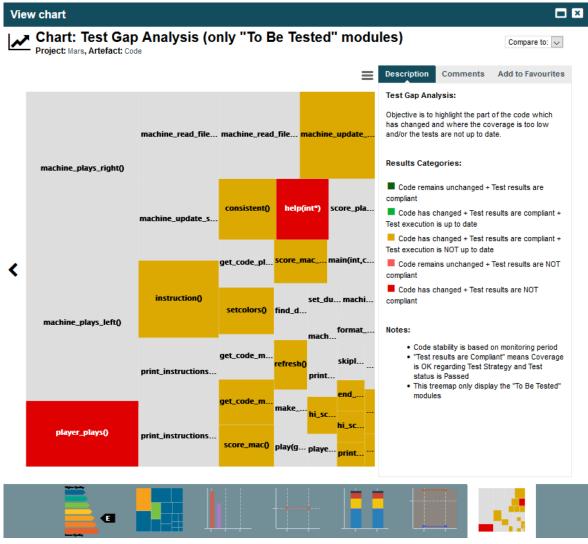

Test status summary for the project

If you click the **Code** node, the dashboard includes a **Test Gap Analysis** chart that helps you adjust your test strategy by highlighting the risky artefacts in your project based on recent code changes and test execution status.

120

https://www.squoring.com/

Getting Started Guide

The Test Gap Analysis chart

The Highlights tab also contains predefined categories to help you analyse insufficiently tested artefacts, modified artefacts and display a summary of artefacts that comply with the code coverage threshold for the project. The screenshot below shows a list of function artefacts in the project together with their code coverage metrics:

| Code | e Coverage | All Modules | | \sim | | | | | | |
|--------------|------------|----------------------------------|------------------------------|-------------------|----------------------|--|----------------------------|-------------------------|------------------------|------------------|
| | Rating + | Artefact ¢ | Code Stability Index + | To be tested ≑ | Critical Factor 🛊 | Average percentage of coverage objective archievement \$ | Statement Cov. status 🜩 | Branch Cov. status ¢ | MCDC Cov. status \$ | Path ¢ |

The Code Coverage highlight showing compliant and non compliant modules

7.2. Ticket Management

Importing tickets related to your project activates the **Ticket Completion Rate** and **Innovation Rate** indicators in your project (new in 18.0).

The Ticket Completion Rate helps you track the ratio of open and closed tickets in your project, while the Innovation Rate is an indicator of the ratio of enhancements versus defects being worked on. Both indicators are enabled when importing tickets using a Data Provider like Mantis or Jira.

122

https://www.squoring.com/

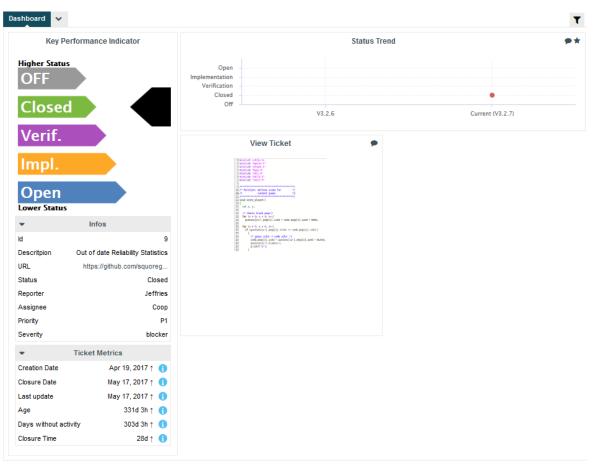

Ticket artefacts in Mars, grouped by component

The dashboard for each ticket provides details about the ticket's activity and status history, as well as a direct link to open the ticket in your ticket management tool.

123

https://www.squoring.com/

Ticket Dashboard

The dashboard for the **Tickets** node (or any ticket container artefact like each component in the Mars project) shows a summary of ticket by status and reporter, as well as a scrumboard so you can keep track of task completion progress.

124

https://www.squoring.com/

Getting Started Guide

Overall Dashboard for all tickets in the project

The ticket Data Provider are based on a common framework for importing tickets from various sources and in various file formats. To try it out in your project, you can start with a JSON or CSV file containing ticket data and define regular patterns to isolate data for the supported ticket metrics:

- → Ticket ID and URL
- → Grouping structure and filtering
- $\ensuremath{\,\,^{\rightarrow}\,}$ Definition of Open, In Progress, In Validation and Cosed statuses
- → Definition of defect and enhancement types
- → Creation and closure dates

125

- → Description, reporter, handler, priority and severity fields
- Any other data you want to import as textual information in Squore

As an example, the following is the definition used to extract data from issues exported from Jira in JSON format:

| ▼ Ticket Data Import |
|---|
| Root Node Tickets |
| Data File JiraExport.json |
| Sheet Name |
| Ticket ID {key} |
| Grouping Structure {fields}{issuetype}{name};{fields}{status}{name} |
| Filtering {fields}{issuetype}{name}=(Task Bug Improvement New Feature) |
| Open Ticket Pattern {fields}{status}{name}=[To Do Open Being Analyzed Spec Validation Estimated Waiting Info Implementing Analysing Reopened] |
| In Development Ticket Pattern {fields}{status}{name}=[Being Analyzed Waiting Info Implementing Analysing] |
| Fixed Ticket Pattern {fields}{status}{name}=[Verifying Available] |
| Closed Ticket Pattern {fields}{status}{name}=[Done Closed Verifying Available Rejected] |
| Defect Pattern {fields}{issuetype}{name}=[Bug] |
| Enhancement Pattern {fields}{issuetype}{name}=[Improvement New Feature] |
| TODO Pattern {fields}{environment}=Jenkins 2.* |
| Creation Date Column {fields}{created} |
| Closure Date Column {fields}{resolutiondate} |
| URL https://issues.jenkins-ci.org/browse/{key} |
| Description Column {fields}{summary} |
| Reporter Column {fields}{reporter}{displayName} |
| Handler Column {fields}{assignee}{displayName} |
| Priority Column {fields}{priority}{name} |
| Severity Column |
| CSV Separator |
| Information Fields {fields}{environment};{fields}{votes} |
| Save Output |

Parameters for a Jira JSON file

Тір

The Jira Data Provider automatically retrieves the file from your Jira instance and uses these parameters by default so you do not have to configure them for each project.

126

https://www.squoring.com/

8. Track Your Favourite Indicators

By clicking on Favourites in the main menu bar, you can view all the charts you marked as favourite in the dashboards across all of your projects. You can group charts into lists and reorder them as you see fit. The charts you mark as favourites are also the ones that are accessible to view on your mobile devices when away from your desk. This section covers everything you need to know about favourites and Squore's mobile interface: Squore Mobile.

8.1. Building a cross-project Dashboard in Favourites

| Each | of | the | chart | thumbnails | has | а | star |
|------|----|-----|-------|------------|-----|---|------|
| (| | | 7 | k | | |) |

icon that you can click to mark a chart as favourite.

Clicking a star icon opens the chart viewer on the Favourites tab, as shown below:

Adding a favourite in the chart viewer

The popup allows you to:

- → Type a custom title and description for your chart so that you can for example write down why you are monitoring it.
- → Select a list of favourites to add the chart to. By default, your charts are added to a list called Unsorted Favourites. You can create more lists and move charts between lists from the Favourites page.

Ref : SUM_Squore

127

https://www.squoring.com/

Select a version of the chart to display. The latest version is selected by default (Last Version), but you can alternatively select the exact version you clicked on (Current Version), or the latest baseline(Last Baseline).

When you are satisfied with your choices, click on **Save** to add the chart to your favourites. You can add charts from any project you have access to.

Refer to the next section to learn how to view and manage the charts you saved as favourites.

8.2. Managing Favourites

| All the | • | from the Explorer we | | list called |
|----------|---------------------|----------------------|--------------------|-------------|
| Unsorted | Favourites. You can | delete this list and | create other lists | using the |
| | | + | | |
| and | | | | |
| | | - | | |
| icons. | | | | |

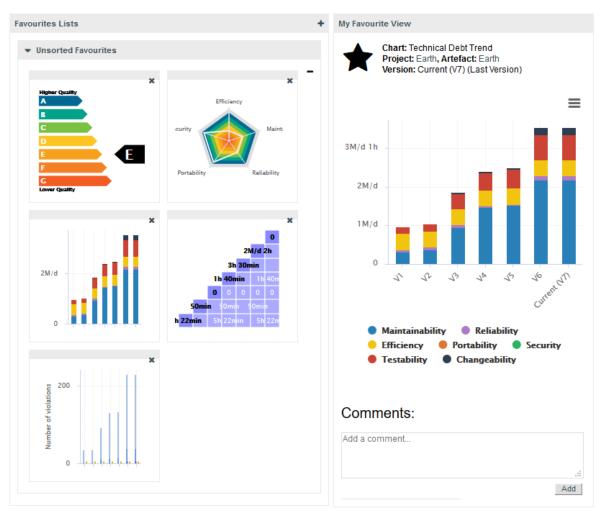

When you have more than one list, you can drag and drop charts between lists.

In order to see the full size of a chart you marked as favourite, click its thumbnail on the left pane to open it in the right pane. The screenshot below shows an example of a list of favourites and a maximised chart. Note that the right pane contains links that allow you to go back to the project's or artefact's dashboard directly.

128

https://www.squoring.com/

Getting Started Guide

The full Favourites page

8.3. Squore Mobile

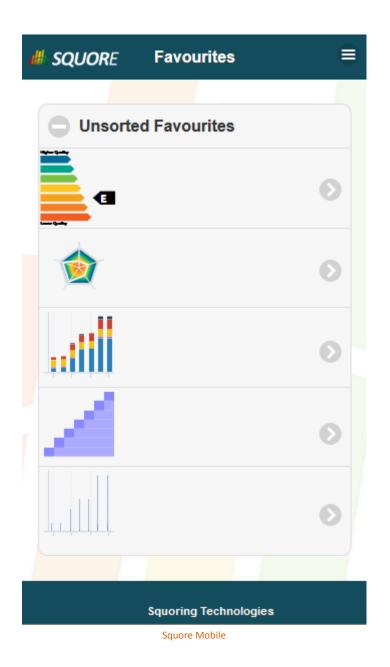

The list of charts you marked as favourites in Squore is the list of charts you can access via Squore Mobile

Squore Mobile is a touch-friendly interface for Squore that is accessible from http://localhost:8180/ SQuORE_Server/Mobile.

129

https://www.squoring.com/

When you log into Squore Mobile, you can swipe through all the charts you added to your favourite lists from your mobile device.

130

https://www.squoring.com/

9. Focus on Your Milestones

Squore allows tracking your progress by setting milestones, which consist of a series of goals for specific metrics at certain dates in the life of your project. In this chapter, you will learn how to set up these goals and how to read dashboard charts that show deviations from these goals or changes in your project milestones.

9.1. Setting up Goals

Not all models support milestones, but if yours does, you will see a Milestones pane on the first page of the project wizard. The Milestones pane is where you can see the existing milestones for a project, with their associated goals and dates.

| t Identification | | | | | | |

In the example above, our model defines 5 milestones (SPRINT1 to SPRINT5) for the lifecycle of our project.

Each milestone has a set date and defines goals for the following key performance indicators in our project:

- Blocker Issues
- Technical Debt
- Self Descriptiveness
- Major Issues

131

Critical Issues

Coding Standard Compliance

The Milestones pane allows you to change the dates and goals for your project. If a milestone is optional and is not relevant for your project, you can remove it by clicking the **x** next to its name. This is possible for all the milestones in our example above. By clicking the **+** icon to the right of the last milestone, you can create a new milestone for the project and define your own goals. You can also add a new goal for your project by selecting a metric from the list at the bottom of the table and clicking the **+** icon.

When you are satisfied with the milestones set for your project, click the **Next** button to continue with the creation of the project.

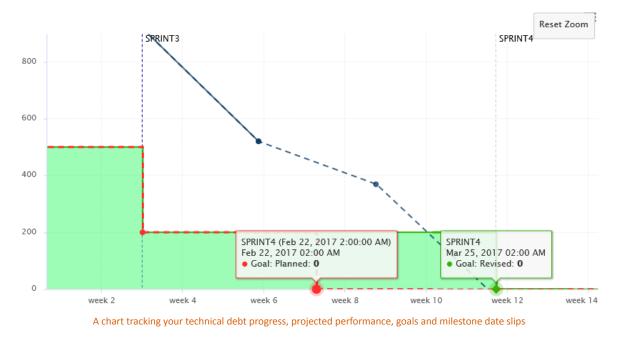

Goals and dates can be modified every time you create a new version of the project if you decide that your schedule slips. Goals and dates are versioned, so your dashboard can always show you when in the timeline of your project you decided to change your milestones.

9.2. Milestones on your Dashboard

When you consult the dashboard of a project that uses milestones, the functionality allows you to:

- → Display the goals defined for each milestone in your project
- → Display the changes made to the goals defined for each milestone
- → Display the date changes for your milestones
- → Show markers for milestone dates and goals

The following is an example of a chart that mixes objectives, projected performance and milestone date changes:

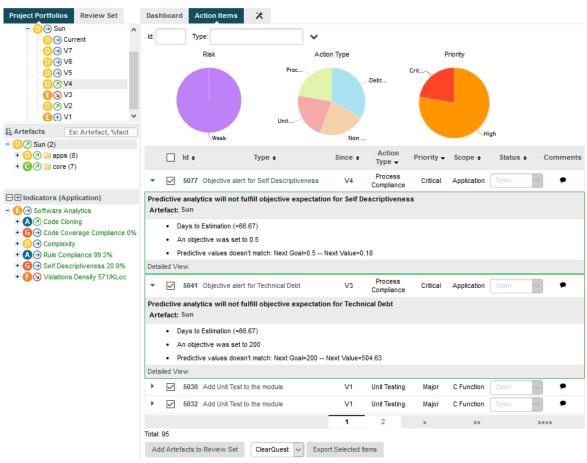

Some action items on your model can also take advantage of this feature to warn you about poor performance:

132

https://www.squoring.com/

SQUORE

Getting Started Guide

Action items based on milestone dates and goals

Тір

For more information on how you can improve your model with milestones and the above chart and action items, refer to Appendix C, *Milestones Tutorial* and the Configuration Guide.

https://www.squoring.com/

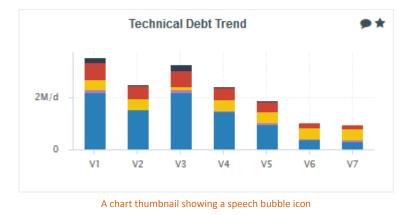

10. Communicating With Squore

10.1. Comments and Notifications

Squore allows posting comments about charts, artefacts, action items and findings. Users in a project team can view and reply to comments when they notice that a discussion thread has received new posts since their last visit. You can also choose when a discussion no longer accepts comments or is removed from the project. In this section, you will learn the basics of commenting all around the dashboard.

10.1.1. Commenting Charts

Every chart on your dashboard shows a speech bubble icon next to its title, as shown in the picture below:

Clicking the icon brings up the chart viewer on the comment tab, in which you can confirm which chart you are commenting on and type your comment.

134

https://www.squoring.com/

SQUORE

Getting Started Guide

When you click Add, your comment is saved, and you can reply or add another comment.

135

https://www.squoring.com/

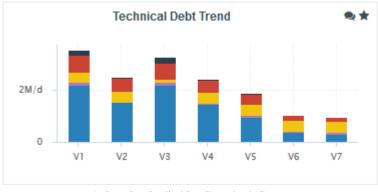

SQUORE

Getting Started Guide

The Comment pop-up after adding your first comment

When you close the pop-up, notice that the speech bubble icon next to the chart you commented changes to indicate that a discussion about this item has been started.

A chart thumbnail with a discussion indicator

10.1.2. Commenting Action Items

In the Action Items tab, you bring up the comment pop up by clicking the speech bubble in the **Comments** column of the table. Links allow you to jump to the Action Item's detailed description, the application level dashboard or the artefact dashboard directly.

136

https://www.squoring.com/

A comment thread initiated about an Action Item

10.1.3. Commenting Findings

On the Findings tab, each violation shows a comment icon that you can click to start a discussion.

| IO Functions shall not be used | 1 | -1 | Squan Sources |
|--|-----------------|------------|----------------------------|
| The input/output library <stdio.h> shall not be used in production Mnemonic: STDIO Characteristics: SUBSET, MISRA, Adaptability, Stability</stdio.h> | uction cod | e (see [| MISRA-C:2004]: RULE 20.9). |
| machine_read_file() apps/machine.c (Line: 11) The input/output library <stdio.h> shall not be used in</stdio.h> | 1 production | 0 code. | |
| Comments | | | × |
| Finding: IO Functions shall not Project: Sun, Artefact: machine_update_scores(in | ed | | |
| Dale, we should relax this, right? Given that it's a test funct OK to mark it as false-positive? | | | |
| | | | Add |

A comment thread initiated about an finding

As on the Dashboard and Action Items tabs, the comment icon indicates whether a discussion has been started about a violation.

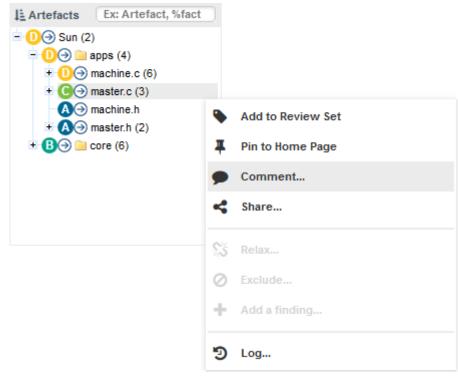

| The input/output library <stdio.h> shall not be used in production code (see [MISRA-C:2004]: RULE 20.9). Mnemonic: STDIO Characteristics: SUBSET, MISRA, Adaptability, Stability</stdio.h> | | | | | | | | |
|--|---|---|----------|--|--|--|--|--|
| machine_read_file() | 1 | 0 | | | | | | |
| apps/machine.c (Line: 11) The input/output library <stdio.h> shall not be used in production code.</stdio.h> | | | R | | | | | |

An ongoing discussion on the Findings tab

10.1.4. Commenting From the Artefact Tree

You can start discussions on artefacts by clicking **Comment...** item in the artefact action menu, as shown below:

The artefact context menu item to bring up the comment pop-up for artefacts

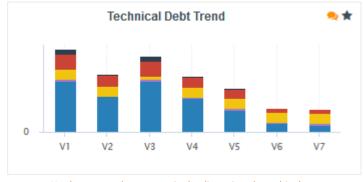

10.1.5. Following Discussions

When you log in to Squore, you can find out which discussions have new comments by looking at the items that show the **New Comment!** icon:

138

https://www.squoring.com/

You have unread comments in the discussion about this chart

In the discussion pop-up, new comments since your last visit are highlighted:

| Comments | × |
|--|-----|
| Action item: No 'Blocker' rules (#11708) Project: Sun, Artefact: machine_update_scores(int) | |
| Add a comment | |
| A | Add |
| Dale Cooper on Apr 18, 2017 8:24 PM I'll fix the code, I know the code around here. | |
| Gordon Cole on Apr 18, 2017 8:41 PM | |
| You should probably look at Action Item #11706, they are related. | |
| Reply | .: |
| ٩ | Add |

A reply to my comment appears in bold

You can also get an exhaustive view of all the discussions for the project by viewing them in the **Comments** tab in the Explorer:

| Dashboard Comments V | | | | |

Overview of discussions about a project in the Comments tab

From this view, discussions can be set to one the following statuses:

- → **Open:** New comments are accepted in this discussion
- → Closed: No new comments are accepted in this discussion, and it will be deleted in the next analysis
- Locked: No new comments are accepted in this discussion, but the discussion thread will be saved for the next analyses

Tip

Any user in the project team can view and take part in all open conversations in the project.

10.2. Linking to Projects

There are two ways to build direct links to projects in Squore:

- → using IDs with the **RestoreContext** page
- → using names with the LoadDashboard page

Each method supports different parameters to build direct links to a tab of the Explorer for the specified project, as explained below.

| http://localhost:8180/ | Links to the Squore Explorer using IDs. The URL accepts the following parameters: | | | | | | | | |
|--------------------------|---|--|--|--|--|--|--|--|--|
| SQuORE_Server/ XHTML/ | modelid to link to a model node in the portfolio | | | | | | | | |
| RestoreContext.xhtml | ProjectId to link to the latest version of the specified project | | | | | | | | |
| | → versionId to link to a specific version of a project | | | | | | | | |
| | artefactId to link to a specific artefact in a project (can be combined with projectId and versionId) | | | | | | | | |
| | • tabName to display a specific tab of the Explorer. This parameter can be combined with any of the ones above and must be one of: | | | | | | | | |
| | → dashboard (default) | | | | | | | | |

- → action-items
- → highlights
- → findings
- reports
- → attributes (Forms)
- → indicators
- → measures
- → annotations

Тір

Users can copy a RestoreContext link from the Home page, the Projects page, or generate one using the **Share...** dialog in an artefact's context menu, which is the only way to find an artefactId. Model IDs are not exposed anywhere in the web interface.

| Shared link | × |
|---|----|
| Link to copy: | |
| http://localhost:8180/SQuORE_Server/XHTML/RestoreContext.xhtml? projectId=8&versionId=23&artefactId=9161&tabName=annotations | |
| | // |

The sharing dialog from the web UI with a full RestoreContext URL

Project and version IDs are printed in the project's output XML file, making it easy to parse and build a URL dynamically when using continuous integration to launch analyses.

Links to the Squore Explorer using names instead of IDs. The URL accepts the following parameters:

- → application (mandatory) to specify the project to link to
- → version (optional) to specify which version of the project to display. When not specified, the latest version fo the project is displayed
- → artefactId (optional) to link to a specific artefact in the project
- tabName to display a specific tab of the Explorer. This parameter can be combined with any of the ones above and must be one of:
 - → dashboard (default)
 - → action-items
 - → highlights
 - → findings
 - → reports
 - → attributes (Forms)
 - → indicators
 - → measures

Ref : SUM_Squore

http://localhost:8180/

XHTML/MyDashboard/

LoadDashboard.xhtml

SQuORE_Server/

dashboard/

https://www.squoring.com/

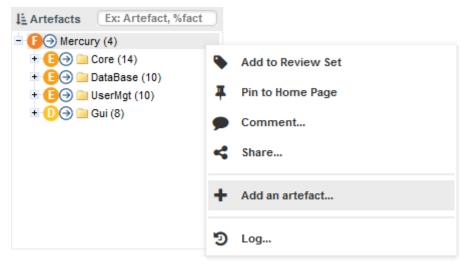

→ annotations

Тір

The following is a URL that links to the version called V5 in the project called Earth. Since no artefactId and tabName are specified, the Dashboard tab will be displayed for the root node of the project: http://localhost:8180/SQuORE_Server/XHTML/ MyDashboard/dashboard/LoadDashboard.xhtml? application=Earth&version=V5.

10.3. Adding and Removing Artefacts Manually

While you review results and comments, you can add artefacts manually to your project as needed. To add an artefact, make sure you are on the Current version of the project and click the node to which you want to add a child artefact. If this node supports adding artefacts, the Add an Artefact option will be available in the menu:

The artefact context menu with the Add an Artefact option highlighted

Click the menu and choose an artefact type and an artefact name to add the artefact to the tree.

Tip

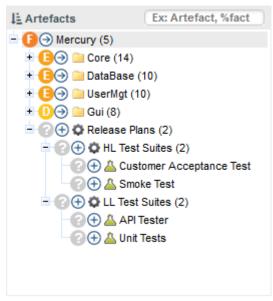

The type of artefact you can add depends on the model you are using. The model also defines where in the tree the new artefacts can be added.

Here is what the Artefact Tree looks like after manually building a test plan tree:

142

https://www.squoring.com/

The artefact tree with manual artefacts not yet rated

When you run a new analysis of the project, the new artefacts will get rated according to what is defined in your model.

Note

Artefacts that were added manually can also be deleted from the tree. Note that artefact edition is tied to a permission in a user's role within a project. To learn more about roles, refer to Section 3.1.2, "User Roles"

10.4. Reporting Project Status

You can generate reports and export data to csv with Squore so you can communicate your progress to others.

In order to create a report, for the currently selected artefact in the tree, click the **Reports** tab in the Explorer. The Reports page opens as shown in the picture below:

| Dashboard Reports | ۲ ۲ |
|-------------------|---------------------------------|
| Reports | |
| Template | Simple Report |
| Format | Portable Document Format (.pdf) |
| Synthetic view | |
| | Create |
| Exports | |
| Name | Files with level G |
| | Create |
| | The Reports page |

The Reports tab offers a choice of report and export types in various output formats. Reports are primarily used to present information visually including charts and data about action items, findings and relaxed artefacts. The output formats currently supported are .pdf, .pptx, .docx.

Reports can be created in full or synthetic view. The synthetic view omits details about the exact location of violations in the code in the report, but provide a link to read the full details in the Squore web interface. The screenshots below show the difference between a synthetic report [http://openwiki.squoring.com/ index.php/File:Report-synthetic-Squoring.pdf] and a full report [http://openwiki.squoring.com/index.php/File:Report-full-Squoring.pdf]. The availability of the full report depends on your licence.

The Project Portfolio export lists all ratings for projects in a specific analysis model

Reports and Exports are highly customisable, consult your Squore administrator or refer to the Squore Configuration Guide to learn more about how to tweak the report contents or format.

10.5. Providing Access to Collaborators

When you create a project, you become its owner, and remain the only user who can view it in Squore by default. In order to make it visible to more users, the project owner has to create a project team of users and groups and assign them roles. This is done in the **Manage** page of a project in the **Team** tab, as shown below:

| Edit Projec Project Proper | | Те | am S | Statistics | | |
|----------------------------|------------------|--------|--------|------------|--------|--|
| Loa | ad from Project: | Mars | | | ✓ Load | |
| Group / User | Role | | Delete | | | |
| 🛔 demo | Owner | \sim | | | | |
| 👗 demo | Project Manager | \sim | × | | | |
| 👗 demo | Quality Engineer | \sim | × | | | |
| 👗 demo | Developer | \sim | × | | | |
| 👗 demo | Tester | \sim | × | | | |
| Select a G Ok Cance | roup or a User: | | | | | |

The Team tab

Тір

The project scope can be set directly from the command line when creating a new project, if you use the **teamUser** and **teamGroup** options. For more details, refer to the Command Line Interface manual.

In order to give visibility to the user **admin** over the projects created by the user **demo**, follow these steps:

1. Log in as the demo user and go to the Projects page.

| 2. | 2. Click | | | | | the | | | | | Manage | | | | | icon | |

| | Tester | |
| | Guest | |

The roles available for the user in this project

This predefined role allows a user to consult the results of baseline versions of a project without making any changes. For more information about roles, consult Section 3.1, "Understanding Profiles and Roles".

6. Click **Apply** to apply your changes.

The admin user can now log in and will see the Earth project in their Explorer.

Ref : SUM_Squore

149

https://www.squoring.com/

If you want to configure the rest of the sample projects the way you configured Earth, you can copy the project team to another project:

- 1. Click on **Manage > Team** for the project Mars
- 2. Select Earth from the Load from Project dropdown and click Load.
- 3. The users and their roles have now been copied as they were set up in the Earth project. You can make adjustments or click **Apply** to confirm your changes.

10.6. Finding Other Projects

List of Projects Owners

A Squore administrator may allow you browse a list of projects created by other users so you can contact them and request to be added to their project's team. When this feature is enabled, you can click the **Ask access to Project Owners** button on the Projects page to view a list of projects that other users have created, as shown below:

| Project ¢ | Group ¢ | Owner ¢ | Owner Email 🛊 |
|-----------|---------|---------|-------------------|
| Earth | public | demo | demo@squoring.com |
| Neptune | public | demo | demo@squoring.com |
| Venus | public | demo | demo@squoring.com |
| Pluto | public | demo | demo@squoring.com |

The list of available projects on the server and their owners

If you want to become a team member of one of the projects listed, click the project owner's e-mail address to send them a message and request to be added to their project's team.

Tip

If the **Ask access to Project Owners** button is not displayed on the Projects page, contact your Squore administrator to set up access following the instructions provided in the Installation and Administration Guide.

10.7. E-mail Notifications

You can configure each project in Squore so that an e-mail notification is sent out after a new version is created. This functionality is available for users who can create and manage projects, either in the **General Information** section of the project wizard, or the in the Project Properties tab of the Manage Project page:

150

https://www.squoring.com/

| 🖋 Edit Project Ear | th | | | | | | |
|--------------------|----------|------------|------------------|---------|------------------------|----------|---|
| Project Properties | Versions | Team | Statistics | | | | |
| | | | | ld | 1 | | |
| | | | | Name | Earth | | 0 |
| | | | Analysis | Model | software_analytics | | |
| | | | (| Group | C/ |] | 0 |
| | | | Creation | n Time | Jun 7, 2018 4:59:03 PM | | |
| | | | 0 | wner | demo |] | 0 |
| | | , | Automatic Base | elining | | | 0 |
| | | Keep old v | ersions of data | a files | | | 0 |
| | | | C | Colour | • | | 0 |
| | | E-mail the | creator of a ve | ersion | On draft On baseline | On error | 0 |
| | | E | -mail team mer | nbers | On draft On baseline | | 0 |
| Ok Cancel | | | | | | | |
| | | E-ma | ail notification | optior | ns in Manage Project | | |

The conditions on which you can to trigger an e-mail are:

- On draft: sends an e-mail every time a draft version is successfully analysed.
- On baseline: sends an e-mail every time a baseline version is successfully analysed, or every time a draft version is baselined.
- On error: sends an e-mail every time an analysis ends with the Warnings or Error status.

The e-mail contains a description of the version, the number of new artefacts, the number of action items, a list of the new action items and the number of new findings.

10.8. Usage Statistics

You can get information on how your collaborators are viewing the projects you manage or the models you develop by using the statistics features of Squore. This section describes the information available to project managers and model developers via **Models > Statistics** and the **Manage Project** page.

10.8.1. Statistics for Project Managers

As a project manager, you can use project statistics to investigate the popularity of your project by going to **Manage > Statistics**.

151

https://www.squoring.com/

:///: SQUORE

Getting Started Guide

When you select a reporting period, the following information is displayed:

- The trend of the number of views for this project uses the colours from the scale of the root indicator as background to help you correlate the project rating with the number of visits.
- → The treemap helps you understand which of the dashboard tabs is the most visited for this project.
- → A table summarises the breakdown of views per user, as well as the number of comments left by each user.

10.8.2. Statistics for Model Developers

You can learn more about the usage of particular features of a model by clicking **Models > Statistics**. For each analysis model, find out how many users consult results, which projects are the most popular and which regions and charts of the dashboard are the most useful for users.

Users

The Users tab displays the information about the number of users and overall connections to the server for projects in this analysis model.

152

https://www.squoring.com/

SQUORE

Getting Started Guide

Projects

On the Projects tab, you can check how many projects had visitors over the selected period.

Dashboard

| | | | Views vs. Averag | ge Load Time | | | |
|-----------|---------|---------------|--------------------------------------|------------------------------------|-----------------------------|-----------------------------|-------------------------------|
| | | | | | | | - |
| | | | dashboard | | | | findings |
| | | | | | | | action-items |
| | | | | | | | |
| URL ¢ | Views 🗸 | % e | Average Time on Page (hh:mm:ss) ¢ | Average Load Time (ms) ¢ | Minimum Load Time (ms) ¢ | Maximum Load Time (ms) ¢ | |
| URL o | Views 🗸 | % ¢ 87.14% | | Average Load Time (ms) ¢ 694 | | | Load Time under |
| | | | (hh:mm:ss) e | Time (ms) 🛊 | Time (ms) ¢ | Time (ms) e | Load Time under seconds \$ |
| dashboard | 61 | 87.14% | (hh:mm:ss) ♦ 00:04:15 | Time (ms) ¢ | Time (ms) ¢ | Time (ms) ¢ 4649 | 98.36 % |

The Dashboard tab allows analysing the usage of each tab on the dashboard. Each tab is represented in a treemap according to how many views it receives. This information can be used to adjust the default display status of each tab or their availability to end users.

153

| All | 13 | 14 ms | 1 |

https://www.squoring.com/

The Charts tab provides information about chart usage in your model: The number of views per chart (per artefact type or for all artefact types), the average loading time and the number of comments.

155

https://www.squoring.com/

11. Keep it Tidy: Project Maintenance in Squore

11.1. Managing Previous Analyses

You can delete or rename one or more of the last versions of a project if needed. This can be done from the **Projects** page if you are the project creator or are a member of a role that allows managing the project.

lf you to manage previous analyses of the Earth project, want the log in as the demo user and click Projects. Click the Manage icon) (

and open the Versions tab to view the list of versions created for this project:

Edit Project Earth

| Pro | ject Pı | roperties Ve | rsions Team Sta | itistics | | | | | | |

The Versions of the Earth project

Тір

The most recent version always appears at the top of the list.

By clicking the pen icon next to the version name, you can rename this analysis. Your changes will immediately be reflected in the Project Portfolios.

In order to delete an analysis, check the box next to the version you want to delete. All versions created after the version you selected will also be checked. Click the **Delete** button to reach a summary page where you can confirm which versions will be deleted, and click **Confirm** to launch the delete process.

Note

If you select to delete all the versions of a project, the entire project will be deleted.

11.2. Deleting a Project

Ref : SUM_Squore

Projects can be deleted by their creator or members of a role that allows to manage projects. In order to delete a project, click **Projects** and click the delete icon

(

next to the project you want to delete. After confirming the operation, the project is deleted from the Squore database and cannot be restored.

11.3. Squore Server Administration

A Squore Administrator can access functionality that does not involve working with projects directly. You can access the **Administration** menu if you need to perform any of the following tasks:

- Create, update, remove and deactivate Squore users (Administration > Users)
- Create, update, and remove groups (Administration > Groups)
- Create, update, and remove profiles (Administration > Profiles)
- → Create, update, and remove roles (Administration > Roles)
- Configure and monitor the Squore Server installation (Administration > System)
- Yiew and manage all projects created on Squore Server (Administration > Projects)
- → Reload the server configuration from disk (Administration > Reload Configuration)
- download the server log (Administration > Server Log)

For more information about administration functionality, consult the Online Help.

11.4. What About Server Maintenance?

Server maintenance, including database backups need to be carried out by a system administrator directly on Squore Server. If you need to know more about the backup options offered by Squore, refer to the Squore Installation and Administration Guide.

157

)

https://www.squoring.com/

12. Repository Connectors

12.1. Folder Path

12.1.1. Description

The simplest method to analyse source code in Squore is to provide a path to a folder contining your code.

Note

Remember that the path supplied for the analysis is a path local to the machine running the analysis, which may be different from your local machine. If you analyse source code on your local machine and then send results to the server, you will not be able to view the source code directly in Squore, since it will not have access to the source code on the other machine. A common workaround to this problem is to use UNC paths (\\Server\Share, smb://server/share...) or a mapped server drive in Windows.

12.1.2. Usage

Folder Path has the following options:

Datapath (path, mandatory) Specify the absolute path to the folder containing the files you want to include in the analysis. The path specified must be accessible from the server.

The full command line syntax for Folder Path is:

```
-r "type=FROMPATH,path=[text]"
```

12.2. Zip Upload

12.2.1. Description

This Repository Connector allows you to upload a zip file containing your sources to analyse. Select a file to upload in the project wizard and it will be extracted and analysed on the server.

Note

The contents of the zip file are extracted into Squore Server's temp folder. If you want to uploaded files to persist, contact your Squore administrator so that the uploaded zip files and extracted sources are moved to a location that is not deleted at each server restart.

12.2.2. Usage

This Repository Connector is only available from the web UI, not from the command line interface.

12.3. CVS

12.3.1. Description

The Concurrent Versions System (CVS), is a client-server free software revision control system in the field of software development.

For more details, refer to http://savannah.nongnu.org/projects/cvs.

Note

The following is a list of commands used by the CSV Repository Connector to retrieve sources:

- > cvs -d \$repository export [-r \$branch] \$project
- → cvs -d \$repository co -r \$artefactPath -d \$tmpFolder

12.3.2. Usage

CVS has the following options:

- → Repository (repository, mandatory) Specify the location of the CVS Repository.
- Project (project, mandatory) Specify the name of the project to get files from.
- → **Tag or Branch (branch)** Specify the tag or branch to get the files from.

The full command line syntax for CVS is:

-r "type=CVS,repository=[text],project=[text],branch=[text]"

12.4. ClearCase

12.4.1. Description

IBM Rational ClearCase is a software configuration management solution that provides version control, workspace management, parallel development support, and build auditing. The command executed on the server to check out source code is: \$cleartool \$view_root_path \$view \$vob_root_path.

For more details, refer to http://www-03.ibm.com/software/products/en/clearcase.

Note

The ClearCase tool is configured for Linux by default. It is possible to make it work for Windows by editing the configuration file

12.4.2. Usage

ClearCase has the following options:

- View root path (view_root_path , mandatory, default: /view) Specify the absolute path of the ClearCase view.
- Vob Root Path (vob_root_path , mandatory, default: /projets) Specify the absolute path of the ClearCase vob.
- View (view) Specify the label of the view to analyse sources from. If no view is specified, the current ClearCase view will be used automatically, as retrieved by the command cleartool pwv -s.
- Server Display View (server_display_view) When viewing source code from the Explorer after building the project, this parameter is used instead of the view parameter specified earlier. Leave this field empty to use the same value as for view.
- Sources Path (sub_path) Specify a path in the view to restrict the scope of the source code to analyse. The value of this field must not contain the vob nor the view. Leave this field empty to analyse the code in the entire view. This parameter is only necessary if you want to restrict to a directory lower than root.

The full command line syntax for ClearCase is:

"type=ClearCase,view_root_path=[text],vob_root_path=[text],view=[text],server_display_view=[text]

-r

12.5. Perforce

12.5.1. Description

The Perforce server manages a central database and a master repository of file versions. Perforce supports both Git clients and clients that use Perforce's own protocol.

For more details, refer to http://www.perforce.com/.

Note

The Perforce repository connector assumes that the specified depot exists on the specified Perforce server, that Squore can access this depot and that the Perforce user defined has the right to access it. The host where the analysis takes place must have a Perforce command-line client (p4) installed and fully functional. The P4PORT environment variable is not read by Squore. You have to set it in the form. The path to the p4 command can be configured in the perforce_conf.tcl file located in the configuration/repositoryConnectors/Perforce folder. The following is a list of commands used by the Perforce Repository Connector to retrieve sources:

→ p4 -p \$p4port [-u username] [-P password] client -i <\$tmpFolder/ p4conf.txt → p4 -p \$p4port [-u username] [-P password] -c \$clientName sync

"\$depot/...@\$label"

 \rightarrow p4 -p \$p4port [-u username] [-P password] client -d \$clientName

```
→ p4 -p $p4port [-u username] [-P password] print -q -o $outputFile
$artefactPath
```

The format of the p4conf.txt file is:

```
Client: $clientName
Root: $tmpFolder
Options: noallwrite noclobber nocompress unlocked nomodtime normdir
SubmitOptions: submitunchanged
view:
$depot/... //$clientName/...
```

12.5.2. Usage

Perforce has the following options:

- P4PORT (p4port, mandatory) Specify the value of P4PORT using the format [protocol:]host:port (the protocol is optional). This parameter is necessary even if you have specified an environment variable on the machine where the analysis is running.
- Depot (depot , mandatory) Specify the name of the depot (and optionnally subforders) containing the sources to be analysed.
- Revision (label) Specify a label, changelist or date to retrieve the corresponding revision of the sources. Leave this field empty to analyse the most recent revision fo the sources.
- Authentication (useAccountCredentials, default: NO_CREDENTIALS)
- → Username (username)
- Password (password)

The full command line syntax for Perforce is:

"type=Perforce,p4port=[text],depot=[text],label=[text],useAccountCredentials=[multipleChoice]

-r

12.6. Git

12.6.1. Description

Git is a free and open source distributed version control system designed to handle everything from small to very large projects with speed and efficiency.

For more details, refer to http://git-scm.com/.

Note

The following is a list of commands used by the Git Repository Connector to retrieve sources:

- > git clone [\$username:\$password@]\$url \$tmpFolder
- → git checkout \$commit
- → git log -1 "--format=%H"
- → git config --get remote.origin.url
- → git clone [\$username:\$password@]\$url \$tmpFolder
- → git checkout \$commit
- → git fetch
- → git --git-dir=\$gitRoot show \$artefactPath

Note

Git 1.7.1 is known to fail with a fatal: HTTP request failed error on CentOS 6.9. For this OS, it is recommended to upgrade to git 2.9 as provided by software collections on https://www.softwarecollections.org/en/scls/rhscl/rh-git29/ and point to the new binary in git_config.tcl or make the change permanent as described on https://access.redhat.com/solutions/527703.

12.6.2. Usage

Git has the following options:

- → URL (url, mandatory) URL of the git repository to get files from. The local, HTTP(s), SSH and Git protocols are supported.
- Branch or commit (commit) This field allows specifying the SHA1 of a commit or a branch name. If a SHA1 is specified, it will be retieved from the default branch. If a branch label is specified, then its latest commit is analysed. Leave this field empty to analyse the latest commit of the default branch.
- Sub-directory (subDir) Specify a subfolder name if you want to restrict the analysis to a subpath of the repository root.
- Authentication (useAccountCredentials, default: NO_CREDENTIALS)
- Jusername (username)
- Password (password)

The full command line syntax for Git is:

"type=Git,url=[text],commit=[text],subDir=[text],useAccountCredentials=[multipleChoice],userna

12.7. PTC Integrity

-r

161

https://www.squoring.com/

12.7.1. Description

This Repository Connector allows analysing sources hosted in PTC Integrity, a software system lifecycle management and application lifecycle management platform developed by PTC.

For more details, refer to http://www.ptc.com/products/integrity/.

Note

You can modify some of the settings of this repository connector if the si.exe and mksAPIViewer.exe binaries are not in your path. For versions that do not support the --xmlapi option, you can also turn off this method of retrieving file information. These settings are available by editing mks_conf.tcl in the repository connector's configuration folder.

12.7.2. Usage

PTC Integrity has the following options:

- Server Hostname (hostname , mandatory) Specify the name of the Integrity server. This value is passed to the command line using the parameter --hostname.
- Port (port) Specify the port used to connect to the Integrity server. This value is passed to the command line using the parameter --port.
- Project (project) Specify the name of the project containing the sources to be analysed. This value is passed to the command line using the --project parameter.
- Revision (revision) Specify the revision number for the sources to be analysed. This value is passed to the command line using the --projectRevision parameter.
- → Scope (scope , default: name:*.c,name:*.h) Specifies the scope (filter) for the Integrity sandbox extraction. This value is passed to the command line using the --scope parameter.
- Authentication (useAccountCredentials, default: NO_CREDENTIALS)
- Jusername (username)
- Password (password)

The full command line syntax for PTC Integrity is:

```
-r
"type=MKS,hostname=[text],port=[text],project=[text],revision=[text],scope=[text],useAccountC
```

12.8. TFS

12.8.1. Description

Team Foundation Server (TFS) is a Microsoft product which provides source code management, reporting, requirements management, project management, automated builds, lab management, testing and release management capabilities. This Repository Connector provides access to the sources hosted in TFS's revision control system.

For more details, refer to https://www.visualstudio.com/products/tfs-overview-vs.

Note

The TFS repository connector (Team Foundation Server - Team Foundation Version Control) assumes that a TFS command-line client (Visual Studio Client or Team Explorer Everywhere) is installed on the Squore server and fully functional. The configuration of this client must be set up in the tfs_conf.tcl

162

https://www.squoring.com/

file. The repository connector form must be filled according to the TFS standard (eg. the Project Path must begin with the '\$' character...). Note that this repository connector works with a temporary workspace that is deleted at the end of the analysis. The following is a list of commands used by the TFS Repository Connector to retrieve sources:

- > tf.exe workspace [/login:\$username,\$password] /server:\$url /noprompt /
 new \$workspace
- > tf.exe workfold [/login:\$username,\$password] /map \$path \$tempFolder /
 workspace:\$workspace
- > tf.exe get [/login:\$username,\$password] /version:\$version /recursive /
 force \$path
- > tf.exe workspace [/login:\$username,\$password] /delete \$workspace
- > tf.exe view [/login:\$username,\$password] /server:\$artefactPath

Note

When using the Java Team Explorer Everywhere client, / is replaced by - and the view command is replaced by print.

12.8.2. Usage

TFS has the following options:

- → URL (URL , mandatory) Specify the URL of the TFS server.
- → Path (path, mandatory) Path the project to be analysed. This path usually starts with \$.
- Version (version) Specify the version of the sources to analyse. This field accepts a changeset number, date, or label. Leave the field empty to analyse the most recent revision of the sources.
- Authentication (useAccountCredentials, default: NO_CREDENTIALS)
- Jusername: (username)
- Password (password)

The full command line syntax for TFS is:

```
"type=TFS,URL=[text],path=[text],version=[text],useAccountCredentials=[multipleChoice],username
```

12.9. Synergy

-r

12.9.1. Description

Rational Synergy is a software tool that provides software configuration management (SCM) capabilities for all artifacts related to software development including source code, documents and images as well as the final built software executable and libraries.

For more details, refer to http://www-03.ibm.com/software/products/en/ratisyne.

Note

The Synergy repository connector assumes that a project already exists and that the Synergy user defined has the right to access it. The host where the analysis takes place must have Synergy installed and fully functional. Note that, as stated in IBM's documentation on http://pic.dhe.ibm.com/infocenter/synhelp/v7m2r0/index.jsp? topic=%2Fcom.ibm.rational.synergy.manage.doc%2Ftopics%2Fsc_t_h_start_cli_session.html, using credentials is only supported on Windows, so use the NO_CREDENTIALS option when Synergy runs

```
163
```

on a Linux host. The following is a list of commands used by the Synergy Repository Connector to retrieve sources:

- > ccm start -d \$db -nogui -m -q [-s \$server] [-pw \$password] [-n \$user -pw
 password]
- → ccm prop "\$path@\$projectSpec"
- > ccm copy_to_file_system -path \$tempFolder -recurse \$projectSpec
- → ccm cat "\$artefactPath@\$projectSpec"
- → ccm stop

12.9.2. Usage

Synergy has the following options:

- Server URL (server) Specify the Synergy server URL, if using a distant server. If specified, the value is used by the Synergy client via the -s parameter.
- → Database (db , mandatory) Specify the database path to analyse the sources it contains.
- Project Specification (projectSpec , mandatory) Specify the project specification for the analysis. Source code contained in this project specification will be analysed recursively.
- Subfolder (subFolder) Specify a subfolder name if you want to restrict the scope of the analysis to a particular folder.
- Authentication: (useAccountCredentials , default: NO_CREDENTIALS) Note that, as stated in IBM's documentation, using credentials is only supported on Windows. The "No Credentials" must be used option when Synergy runs on a Linux host. For more information, consult http://pic.dhe.ibm.com/infocenter/synhelp/v7m2r0/index.jsp?topic= %2Fcom.ibm.rational.synergy.manage.doc%2Ftopics%2Fsc_t_h_start_cli_session.html.
- → (name)
- > Password (password)

The full command line syntax for Synergy is:

```
"type=Synergy,server=[text],db=[text],projectSpec=[text],subFolder=[text],useAccountCredentia
```

12.10. SVN

-r

12.10.1. Description

Connecting to an SVN server is supported using svn over ssh, or by using a username and password.

For more details, refer to https://subversion.apache.org/.

Note

The following is a list of commands used by the SVN Repository Connector to retrieve sources (you can edit the common command base or the path to the executable in <SQUORE_HOME>/ configuration/repositoryConnectors/SVN/svn_conf.tcl if needed):

- → svn info --xml --non-interactive --trust-server-cert --no-auth-cache [-username \$username] [--password \$password] [-r \$revision] \$url
- → svn export --force --non-interactive --trust-server-cert --no-auth-cache
 [--username \$username] [--password \$password] [-r \$revision] \$url

https://www.squoring.com/

```
164
```

This Repository Connector now includes a hybrid SVN mode saves you an extra checkout of your source tree when using the local_path attribute (new in 18.0). Consult the reference below for more details.

12.10.2. Usage

SVN has the following options:

- IRL (url, mandatory) Specify the URL of the SVN repository to export and analyse. The following protocols are supported: svn://, svn+ssh://, http://, https://.
- -> Revision (rev) Specify a revision number in this field, or leave it blank to analyse files at the HEAD revision.
- External references (externals , default: exclude) Specify if when extracting sources from SVN the system should also extract external references.
- Sources are already extracted in (local_path) Specify a path to a folder where the sources have already been extracted. When using this option, sources are analysed in the specified folder instead of being checked out from SVN. At the end of the analysis, the url and revision numbers are attached to the analysed sources, so that any source code access from the web interface always retrieves files from SVN. This mode is mostly used to save an extra checkout in some continuous integration scenarios.
- Authentication (useAccountCredentials, default: NO_CREDENTIALS)
- Jusername (username)
- Password (password)

The full command line syntax for SVN is:

"type=SVN,url=[text],rev=[text],externals=[multipleChoice],local_path=[text],useAccountCredent

12.11. Folder (use GNATHub)

12.11.1. Description

Retrieve Sources from a folder on the server, use GNATHub to limit the files (compatible with GNAT Pro versions 7.4.2 up to 18.2).

Note

-r

This Repository Connector will only be available after you configure your server or client config.xml with the path to your gnathub executable with a <path name="gnatub" path="C:\tools \GNAThub\gnathub.exe" /> definition. Consult the Configuration Manual for more information about referencing external executables.

12.11.2. Usage

Folder (use GNATHub) has the following options:

- Path of the source files (path) Specify the absolute path to the files you want to include in the analysis. The path specified must be accessible from the server.
- Path of the gnathub.db file (gnatdb) Specify the absolute path of the gnathub.db file.
- → Root path for sources in the GNAT DB (gnat_root) Specify the root path for sources in the GNAT DB

The full command line syntax for Folder (use GNATHub) is:

-r "type=GNAThub,path=[text],gnatdb=[text],gnat_root=[text]"

12.12. Using Multiple Nodes

Squore allows using multiple repositories in the same analysis. If your project consists of some code that is spread over two distinct servers or SVN repositories, you can set up your project so that it includes both locations in the project analysis. This is done by labelling each source code node before specifying parameters, as shown below

```
-r "type=FROMPATH,alias=Node1,path=/home/projects/client-code"
```

-r "type=FROMPATH,alias=Node2,path=/home/projects/common/lib"

Note that only alpha-numeric characters are allowed to be used as labels. In the artefact tree, each node will appear as a separate top-level folder with the label provided at project creation.

Using multiple nodes, you can also analyse sources using different Repository Connectors in the same analysis:

```
-r "type=FROMPATH,alias=Node1,path=/home/projects/common-config"
```

-r "type=SVN,alias=Node2,url=svn+ssh://10.10.0.1/var/svn/project/src,rev=HEAD"

166

https://www.squoring.com/

13. Data Providers

This chapter describe the available Data Providers and the default parameters that they accept via the Command Line Interface.

13.1. AntiC

13.1.1. Description

AntiC is a part of the jlint static analysis suite and is launched to analyse C and C++ source code and produce findings.

For more details, refer to http://jlint.sourceforge.net/.

Note

On Linux, the antiC executable must be compiled manually before you run it for the first time by running the command:

cd <SQUORE_HOME>/addons/tools/Antic_auto/bin/ && gcc antic.c -o antic

13.1.2. Usage

AntiC has the following options:

Source code directory to analyse (dir) Leave this parameter empty if you want to analyse all sources specified above.

The full command line syntax for AntiC is:

```
-d "type=Antic_auto,dir=[text]"
```

13.2. Automotive Coverage Import

13.2.1. Description

Automotive Coverage Import provides a generic import mechanism for coverage results at function level.

13.2.2. Usage

Automotive Coverage Import has the following options:

→ CSV file Enter the path to the CSV containing the coverage (csv) data. The expected format of each line contained in the file is PATH;NAME;TESTED_C1;OBJECT_C1;TESTED_MCC;OBJECT_MCC;TESTED_MCDC;OBJECT_MCDC

The full command line syntax for Automotive Coverage Import is:

```
-d "type=Automotive_Coverage,csv=[text]"
```

13.3. Automotive Tag Import

13.3.1. Description

This data provider allows setting values for attributes in the project.

13.3.2. Usage

Automotive Tag Import has the following options:

→ CSV file (csv) Specify the path to the file containing the metrics.

The full command line syntax for Automotive Tag Import is:

-d "type=Automotive_Tag_Import,csv=[text]"

13.4. BullseyeCoverage Code Coverage Analyzer

13.4.1. Description

BullseyeCoverage is a code coverage analyzer for C++ and C. The coverage report file is used to generate metrics.

For more details, refer to http://www.bullseye.com/.

13.4.2. Usage

BullseyeCoverage Code Coverage Analyzer has the following options:

HTML report (html) Specify the path to the HTML report file generated by BullseyeCoverage.

The full command line syntax for BullseyeCoverage Code Coverage Analyzer is:

```
-d "type=BullseyeCoverage,html=[text]"
```

13.5. CPD

13.5.1. Description

CPD is an open source tool which generates Copy/Paste metrics. The dectection of duplicated blocks is set to 100 tokens. CPD provides an XML file which can be imported to generate metrics as well as findings.

For more details, refer to http://pmd.sourceforge.net/pmd-5.3.0/usage/cpd-usage.html.

13.5.2. Usage

CPD has the following options:

→ CPD XML results (xml) Specify the path to the XML results file generated by CPD. The minimum supported version is PMD/CPD 4.2.5.

The full command line syntax for CPD is:

```
-d "type=CPD, xml=[text]"
```

13.6. Cppcheck

13.6.1. Description

Cppcheck is a static analysis tool for C/C++ applications. The tool provides an XML output which can be imported to generate findings.

For more details, refer to http://cppcheck.sourceforge.net/.

13.6.2. Usage

Cppcheck has the following options:

Cppcheck XML results (xml) Specify the path to the XML results file from Cppcheck. Note that the minimum required version of Cppcheck for this data provider is 1.61.

The full command line syntax for Cppcheck is:

-d "type=CPPCheck,xml=[text]"

13.7. Cppcheck (plugin)

13.7.1. Description

Cppcheck is a static analysis tool for C/C++ applications. The tool provides an XML output which can be imported to generate findings.

For more details, refer to http://cppcheck.sourceforge.net/.

Note

On Windows, this data provider requires an extra download to extract the Cppcheck binary in <SQUORE_HOME>/addons/tools/CPPCheck_auto/ and the MS Visual C++ 2010 Redistributable Package available from Microsoft. On Linux, you can install the cppcheck application anywhere you want. The path to the Cppcheck binary for Linux can be configured in config.tcl. For more information, refer to the Installation and Administration Guide's Third-Party Plugins and Applications [../install_admin_manual/index.html#sect_thirdparty_plugins] section.

13.7.2. Usage

Cppcheck (plugin) has the following options:

- Source code folder (dir) Specify the folder containing the source files to analyse. If you want to analyse all of source repositories specified for the project, leave this field empty.
- Ignore List (ignores) Specify a semi-colon-separated list of source files or source file directories to exclude from the check. For example: "lib/;folder2/". Leave this field empty to deactivate this option and analyse all files with no exception.

The full command line syntax for Cppcheck (plugin) is:

-d "type=CPPCheck_auto,dir=[text],ignores=[text]"

13.8. CPPTest

13.8.1. Description

Parasoft C/C++test is an integrated solution for automating a broad range of best practices proven to improve software development team productivity and software quality for C and C++. The tool provides an XML output file which can be imported to generate findings and metrics.

For more details, refer to http://www.parasoft.com/product/cpptest/.

13.8.2. Usage

CPPTest has the following options:

XML results file (xml) Specify the path to the CPPTest results file. This data provider is compatible with files exported from CPPTest version 7.2.10.34 and up.

The full command line syntax for CPPTest is:

```
-d "type=CPPTest, xml=[text]"
```

13.9. Cantata

13.9.1. Description

Cantata is a Test Coverage tool. It provides an XML output file which can be imported to generate coverage metrics at function level.

For more details, refer to http://www.qa-systems.com/cantata.html.

13.9.2. Usage

Cantata has the following options:

→ Cantata XML results (xml) Specify the path to the XML results file from Cantata 6.2

The full command line syntax for Cantata is:

```
-d "type=Cantata,xml=[text]"
```

13.10. CheckStyle

13.10.1. Description

CheckStyle is an open source tool that verifies that Java applications adhere to certain coding standards. It produces an XML file which can be imported to generate findings.

For more details, refer to http://checkstyle.sourceforge.net/.

13.10.2. Usage

CheckStyle has the following options:

CheckStyle results file (xml) Point to the XML file that contains Checkstyle results. Note that the minimum supported version is Checkstyle 5.3.

SQUORE

Getting Started Guide

The full command line syntax for CheckStyle is:

-d "type=CheckStyle,xml=[text]"

13.11. CheckStyle (plugin)

13.11.1. Description

CheckStyle is an open source tool that verifies that Java applications adhere to certain coding standards. It produces an XML file which can be imported to generate findings.

For more details, refer to http://checkstyle.sourceforge.net/.

Note

This data provider requires an extra download to extract the CheckStyle binary in <SQUORE_HOME>/addons/tools/CheckStyle_auto/. For more information, refer to the Installation and Administration Guide's Third-Party Plugins and Applications [../ install_admin_manual/index.html#sect_thirdparty_plugins] section.. You may also deploy your own version of CheckStyle and force the Data Provider to use it by editing <SQUORE_HOME>/ configuration/tools/CheckStyle_auto/config.tcl.

13.11.2. Usage

CheckStyle (plugin) has the following options:

- Configuration file (configFile) A Checkstyle configuration specifies which modules to plug in and apply to Java source files. Modules are structured in a tree whose root is the Checker module. Specify the name of the configuration file only, and the data provider will try to find it in the CheckStyle_auto folder of your custom configuration. If no custom configuration file is found, a default configuration will be used.
- > Xmx (xmx , default: 1024m) Maximum amount of memory allocated to the java process launching Checkstyle.
- Excluded directory pattern (excludedDirectoryPattern) Java regular expression of directories to exclude from CheckStyle, for example: ^test|generated-sources|.*-report\$ or ou ^lib\$

The full command line syntax for CheckStyle (plugin) is:

"type=CheckStyle_auto,configFile=[text],xmx=[text],excludedDirectoryPattern=[text]"

13.12. CheckStyle for SQALE (plugin)

13.12.1. Description

CheckStyle is an open source tool that verifies that Java applications adhere to certain coding standards. It produces an XML file which can be imported to generate findings.

For more details, refer to http://checkstyle.sourceforge.net/.

Note

-d

This data provider requires an extra download to extract the CheckStyle binary in <SQUORE_HOME>/addons/tools/CheckStyle_auto_for_SQALE/. For more

information, refer to the Installation and Administration Guide's Third-Party Plugins and Applications [../install_admin_manual/index.html#sect_thirdparty_plugins] section.

13.12.2. Usage

CheckStyle for SQALE (plugin) has the following options:

- Configuration file (configFile, default: config_checkstyle_for_sqale.xml) A Checkstyle configuration specifies which modules to plug in and apply to Java source files. Modules are structured in a tree whose root is the Checker module. Specify the name of the configuration file only, and the data provider will try to find it in the CheckStyle_auto folder of your custom configuration. If no custom configuration file is found, a default configuration will be used.
- > Xmx (xmx , default: 1024m) Maximum amount of memory allocated to the java process launching Checkstyle.

The full command line syntax for CheckStyle for SQALE (plugin) is:

-d "type=CheckStyle_auto_for_SQALE,configFile=[text],xmx=[text]"

13.13. Cobertura format

13.13.1. Description

Cobertura is a free code coverage library for Java. Its XML report file can be imported to generate code coverage metrics for your Java project.

For more details, refer to http://cobertura.github.io/cobertura/.

13.13.2. Usage

Cobertura format has the following options:

XML report (xml) Specify the path to the XML report generated by Cobertura (or by a tool able to produce data in this format).

The full command line syntax for Cobertura format is:

```
-d "type=Cobertura,xml=[text]"
```

13.14. CodeSonar

13.14.1. Description

Codesonar is a static analysis tool for C and C++ code designed for zero tolerance defect environments. It provides an XML output file which is imported to generate findings.

For more details, refer to http://www.grammatech.com/codesonar.

13.14.2. Usage

CodeSonar has the following options:

172

https://www.squoring.com/

→ XML results file (xml) Specify the path to the XML results file generated by Codesonar. The minimum version of Codesonar compatible with this data provider is 3.3.

The full command line syntax for CodeSonar is:

```
-d "type=CodeSonar,xml=[text]"
```

13.15. Compiler

13.15.1. Description

Compiler allows to import information from compiler logs.

13.15.2. Usage

Compiler has the following options:

Compiler output file (txt, mandatory) Specify the path to a CSV compiler log file. Each line needs to match the following format: Path;Line;Rule;Descr where Rule is one of COMP_ERR, COMPILER_WARN or COMPILER_INFO.

The full command line syntax for Compiler is:

-d "type=Compiler,txt=[text]"

13.16. Coverity

13.16.1. Description

Coverity is a static analysis tool for C, C++, Java and C#. It provides an XML output which can be imported to generate findings.

For more details, refer to http://www.coverity.com/.

13.16.2. Usage

Coverity has the following options:

→ XML results file (xml) Specify the path to the XML file containing Coverity results.

The full command line syntax for Coverity is:

```
-d "type=Coverity,xml=[text]"
```

13.17. ESLint

13.17.1. Description

ESLint is an open source tool that verifies that JavaScript applications adhere to certain coding standards. It produces an XML file which can be imported to generate findings.

For more details, refer to https://eslint.org/.

Note

This Data Provider is new in Squore 18.0

13.17.2. Usage

ESLint has the following options:

→ ESLint results file (xml) Point to the XML file that contains ESLint results in Checkstyle format.

The full command line syntax for ESLint is:

-d "type=ESLint,xml=[text]"

13.18. FindBugs

13.18.1. Description

Findbugs is an open source tool that looks for bugs in Java code. It produces an XML result file which can be imported to generate findings.

For more details, refer to http://findbugs.sourceforge.net/.

13.18.2. Usage

FindBugs has the following options:

XML results file (xml) Specify the location of the XML file containing Findbugs results. Note that the minimum supported version of FindBugs is 1.3.9.

The full command line syntax for FindBugs is:

-d "type=Findbugs,xml=[text]"

13.19. FindBugs (plugin)

13.19.1. Description

Findbugs is an open source tool that looks for bugs in Java code. It produces an XML result file which can be imported to generate findings. Note that the data provider requires an extra download to extract the Findbugs binary in [INSTALLDIR]/addons/tools/Findbugs_auto/. You are free to use FindBugs 3.0 or FindBugs 2.0 depending on what your standard is. For more information, refer to the Installation and Administration Manual's "Third-Party Plugins and Applications" section.

For more details, refer to http://findbugs.sourceforge.net/.

Note

This data provider requires an extra download to extract the Findbugs binary in <SQUORE_HOME>/ addons/tools/Findbugs_auto/. For more information, refer to the Installation and Administration Guide's Third-Party Plugins and Applications [../install_admin_manual/ index.html#sect_thirdparty_plugins] section.

13.19.2. Usage

FindBugs (plugin) has the following options:

- Classes (class_dir, mandatory) Specify the folders and/or jar files for your project in classpath format, or point to a text file that contains one folder or jar file per line.
- Auxiliary Class path (auxiliarypath) Specify a list of folders and/or jars in classpath format, or specify the path to a text file that contains one folder or jar per line. This information will be passed to FindBugs via the -auxclasspath parameter.
- Memory Allocation (xmx, default: 1024m) Maximum amount of memory allocated to the java process launching FindBugs.

The full command line syntax for FindBugs (plugin) is:

-d "type=Findbugs_auto,class_dir=[text],auxiliarypath=[text],xmx=[text]"

13.20. Function Relaxer

13.20.1. Description

Function Relaxer provides a generic import mechanism for relaxing functions in source code.

13.20.2. Usage

Function Relaxer has the following options:

→ CSV File (csv)

The full command line syntax for Function Relaxer is:

```
-d "type=Function_Relaxer,csv=[text]"
```

13.21. FxCop

13.21.1. Description

FxCop is an application that analyzes managed code assemblies (code that targets the .NET Framework common language runtime) and reports information about the assemblies, such as possible design, localization, performance, and security improvements. FxCop generates an XML results file which can be imported to generate findings.

For more details, refer to https://msdn.microsoft.com/en-us/library/bb429476(v=vs.80).aspx.

13.21.2. Usage

FxCop has the following options:

→ XML results file (xml) Specify the XML file containing FxCop's analysis results. Note that the minimum supported version of FxCop is 1.35.

The full command line syntax for FxCop is:

```
-d "type=FxCop,xml=[text]"
```

13.22. GCov

13.22.1. Description

GCov is a Code coverage program for C application. GCov generates raw text files which can be imported to generate metrics.

For more details, refer to http://gcc.gnu.org/onlinedocs/gcc/Gcov.html.

13.22.2. Usage

GCov has the following options:

- Directory containing results files (dir) Specify the path of the root directory containing the GCov results files.
- → Results files extension (ext , default: *.c.gcov) Specify the file extension of GCov results files.

The full command line syntax for GCov is:

-d "type=GCov,dir=[text],ext=[text]"

13.23. GNATcheck

13.23.1. Description

GNATcheck is an extensible rule-based tool that allows developers to completely define a coding standard. The results are output to a log file or an xml file that can be imported to generate findings.

For more details, refer to http://www.adacore.com/gnatpro/toolsuite/gnatcheck/.

13.23.2. Usage

GNATcheck has the following options:

→ Log or xml file (txt) Specify the path to the log file or the xml file generated by the GNATcheck run.

The full command line syntax for GNATcheck is:

-d "type=GnatCheck,txt=[text]"

13.24. GNATCompiler

13.24.1. Description

GNATCompiler is a free-software compiler for the Ada programming language which forms part of the GNU Compiler Collection. It supports all versions of the language, i.e. Ada 2012, Ada 2005, Ada 95 and Ada 83. It creates a log file that can be imported to generate findings.

For more details, refer to http://www.adacore.com/gnatpro/toolsuite/compilation/.

176

https://www.squoring.com/

13.24.2. Usage

GNATCompiler has the following options:

→ Log file (log) Specify the path to the log file containing the compiler warnings.

The full command line syntax for GNATCompiler is:

-d "type=GnatCompiler,log=[text]"

13.25. JSHint

13.25.1. Description

JSHint is an open source tool that verifies that JavaScript applications adhere to certain coding standards. It produces an XML file which can be imported to generate findings.

For more details, refer to http://jshint.com/.

Note

This Data Provider is new in Squore 18.0

13.25.2. Usage

JSHint has the following options:

→ JSHint results file (Checkstyle formatted): (xml) Point to the XML file that contains JSHint results Checkstyle formatted.

The full command line syntax for JSHint is:

-d "type=JSHint, xml=[text]"

13.26. JUnit Format

13.26.1. Description

JUnit is a simple framework to write repeatable tests. It is an instance of the xUnit architecture for unit testing frameworks. JUnit XML result files are imported as test artefacts and links to tested classes are generated in the project.

For more details, refer to http://junit.org/.

Note

The JUnit Data Provider no longer produces findings. Instead, it creates test artefacts (new in 18.0) with a Pass/Fail status so you can filter the artefacts in the Explorer or create action items based on a test's status.

13.26.2. Usage

JUnit Format has the following options:

177

https://www.squoring.com/

© 2019 Squoring Technologies All rights reserved. This material may not be reproduced, displayed, modified or distributed without the express prior written permission of the copyright holder. Squore is protected by an Interdeposit Certification registered with Agence pour la Protection des Programmes under the Inter Deposit Digital Number IDDN.FR.001.390035.001.S.P.2013.000.10600.

- Results folder (resultDir, mandatory) Specify the path to the folder containing the JUnit results (or by a tool able to produce data in this format). The data provider will parse subfolders recursively. Note that the minimum support version of JUnit is 4.10.
- File Pattern (filePattern, mandatory, default: TEST-*.xml) Specify the pattern for files to read reports from.
- Root Artefact (root, mandatory, default: tests[type=TEST_FOLDER]/junit[type=TEST_FOLDER]) Specify the name and type of the artefact under which the test artefacts will be created.

The full command line syntax for JUnit Format is:

-d "type=JUnit,resultDir=[text],filePattern=[text],root=[text]"

13.27. ЈаСоСо

13.27.1. Description

JaCoCo is a free code coverage library for Java. Its XML report file can be imported to generate code coverage metrics for your Java project.

For more details, refer to http://www.eclemma.org/jacoco/.

13.27.2. Usage

JaCoCo has the following options:

XML report (xml, mandatory) Specify the path to the XML report generated by JaCoCo. Note that the folder containing the XML file must also contain JaCoCo's report DTD file, available from http:// www.eclemma.org/jacoco/trunk/coverage/report.dtd. XML report files are supported from version 0.6.5.

The full command line syntax for JaCoCo is:

-d "type=Jacoco,xml=[text]"

13.28. Klocwork

13.28.1. Description

Klocwork is a static analysis tool. Its XML result file can be imported to generate findings.

For more details, refer to http://www.klocwork.com.

13.28.2. Usage

Klocwork has the following options:

XML results file (xml) Specify the path to the XML results file exported from Klocwork. Note that Klocwork version 9.6.1 is the minimum required version.

The full command line syntax for Klocwork is:

```
-d "type=Klocwork,xml=[text]"
```

13.29. Rational Logiscope

13.29.1. Description

The Logiscope suite allows the evaluation of source code quality in order to reduce maintenance cost, error correction or test effort. It can be applied to verify C, C++, Java and Ada languages and produces a CSV results file that can be imported to generate findings.

For more details, refer to http://www.kalimetrix.com/en/logiscope.

13.29.2. Usage

Rational Logiscope has the following options:

→ RuleChecker results file (csv) Specify the path to the CSV results file from Logiscope.

The full command line syntax for Rational Logiscope is:

```
-d "type=Logiscope,csv=[text]"
```

13.30. MSTest

13.30.1. Description

MS-Test automates the process of testing Windows applications. It combines a Windows development language, Basic, with a testing-oriented API.

For more details, refer to https://en.wikipedia.org/wiki/Visual_Test.

Note This Data Provider is new in Squore 18.0

13.30.2. Usage

MSTest has the following options:

- **MSTest results directory (resultDir)** Specify the path to the results directory generated by MSTest.
- Fest result file pattern (filePattern) Specify the pattern of files to extract Test data from.

The full command line syntax for MSTest is:

-d "type=MSTest,resultDir=[text],filePattern=[text]"

13.31. MemUsage

13.31.1. Description

13.31.2. Usage

MemUsage has the following options:

→ Memory Usage excel file (excel)

The full command line syntax for MemUsage is:

-d "type=MemUsage,excel=[text]"

13.32. NCover

13.32.1. Description

NCover is a Code coverage program for C# application. NCover generates an XML results file which can be imported to generate metrics.

For more details, refer to http://www.ncover.com/.

13.32.2. Usage

NCover has the following options:

XML results file (xml) Specify the location of the XML results file generated by NCover. Note that the minimum supported version is NCover 3.0.

The full command line syntax for NCover is:

-d "type=NCover,xml=[text]"

13.33. Oracle PLSQL compiler Warning checker

13.33.1. Description

This data provider reads an Oracle compiler log file and imports the warnings as findings. Findings extracted from the log file are filtered using a prefix parameter.

For more details, refer to http://www.oracle.com/.

13.33.2. Usage

Oracle PLSQL compiler Warning checker has the following options:

- Compiler log file (log)
- → Prefixes (prefix Prefixes their replacements specified and as) are pairs using the syntax [prefix1|node1;prefix2|node2]. Leave this field empty to disable filtering. The parsing algorithm looks for lines fitting this pattern: [PATH;SCHEMA;ARTE ID;ARTE TYPE;LINE;COL;SEVERITY TYPE;WARNING ID;SEVERITY ID;DESCR] and keeps lines where [PATH] begins with one of the input prefixes. In each kept [PATH], [prefix] is replaced by [node]. If [node] is empty, [prefix] is removed from [PATH], but not replaced. Some valid syntaxes for prefix: One prefix to remove: svn://aaaa:12345/valid/path/from/svn One prefix to replace: svn:// aaaa:12345/valid/path/from/svn|node1 Two prefixes to remove: svn://aaaa:12345/valid/path/from/ svn|;svn://bbbb:12345/valid/path/from/other_svn| Two prefixes to remove: svn://aaaa:12345/valid/ path/from/svn;svn://bbbb:12345/valid/path/from/other svn Two prefixes to replace: svn://aaaa:12345/ valid/path/from/svn|node1;svn://bbbb:12345/valid/path/from/other_svn|node2

The full command line syntax for Oracle PLSQL compiler Warning checker is:

-d "type=Oracle_PLSQLCompiler,log=[text],prefix=[text]"

13.34. MISRA Rule Checking using PC-lint

13.34.1. Description

PC-lint is a static code analyser. The PC-lint data provider reads an PC-lint log file and imports MISRA violations as findings.

For more details, refer to http://www.gimpel.com/html/pcl.htm.

13.34.2. Usage

MISRA Rule Checking using PC-lint has the following options:

- -> Log file folder (logDir) Specify the path to the folder containing the PC-lint log files.
- Extensions to exclude (excludedExtensions , default: .h;.H) Specify the file extensions to exclude from the reported violations.

The full command line syntax for MISRA Rule Checking using PC-lint is:

-d "type=PC_Lint_MISRA,logDir=[text],excludedExtensions=[text]"

13.35. PMD

13.35.1. Description

PMD scans Java source code and looks for potential problems like possible bugs, dead code, sub-optimal code, overcomplicated expressions, duplicate code... The XML results file it generates is read to create findings.

For more details, refer to http://pmd.sourceforge.net.

13.35.2. Usage

PMD has the following options:

→ XML results file (xml) Specify the path to the PMD XML results file. Note that the minimum supported version of PMD for this data provider is 4.2.5.

The full command line syntax for PMD is:

-d "type=PMD, xml=[text]"

13.36. PMD (plugin)

13.36.1. Description

PMD scans Java source code and looks for potential problems like possible bugs, dead code, sub-optimal code, overcomplicated expressions, duplicate code ... The XML results file it generates is read to create findings.

For more details, refer to http://pmd.sourceforge.net.

Note

This data provider requires an extra download to extract the PMD binary in <SQUORE_HOME>/addons/tools/PMD_auto/. For more information, refer to the Installation and Administration Guide's Third-Party Plugins and Applications [../install_admin_manual/ index.html#sect_thirdparty_plugins] section.. You may also deploy your own version of PMD and force the Data Provider to use it by editing <SQUORE_HOME>/configuration/tools/ PMD_auto/config.tcl.

13.36.2. Usage

PMD (plugin) has the following options:

Ruleset file (configFile) Specify the path to the PMD XML ruleset you want to use for this analysis. If you do not specify a ruleset, the default one from INSTALLDIR/addons/tools/PMD_autow ill be used.

The full command line syntax for PMD (plugin) is:

```
-d "type=PMD_auto,configFile=[text]"
```

13.37. Polyspace

13.37.1. Description

Polyspace is a static analysis tool which includes a MISRA checker. It produces an XML output which can be imported to generate findings. Polyspace Verifier detects RTE (RunTime Error) such as Division by zero, Illegal Deferencement Pointer, Out of bound array index... Such information is turned into statistical measures at function level. Number of Red (justified/non-justified), Number of Grey (justified/non-justified), Number of Orange (justified/non-justified), Number of Green.

For more details, refer to http://www.mathworks.com/products/polyspace/index.html.

13.37.2. Usage

Polyspace has the following options:

- DocBook results file (xml) Specify the path to the DocBook (main xml file) generated by Polyspace.
- Ignore source file path (ignoreSourceFilePath , default: false) Removes all path elements when doing the mapping between files in Squore project and files in the Pomyspace report. Becareful this can work only if file names in Squore project are unique.

The full command line syntax for Polyspace is:

-d "type=Polyspace,xml=[text],ignoreSourceFilePath=[booleanChoice]"

13.38. MISRA Rule Checking with QAC

13.38.1. Description

QAC identifies problems in C source code caused by language usage that is dangerous, overly complex, nonportable, difficult to maintain, or simply diverges from coding standards. Its CSV results file can be imported to generate findings.

For more details, refer to http://www.phaedsys.com/principals/programmingresearch/pr-qac.html.

13.38.2. Usage

MISRA Rule Checking with QAC has the following options:

- Code Folder (logDir) Specify the path to the folder that contains the annotated files to process. For the findings to be successfully linked to their corresponding artefact, several requirements have to be met: The annotated file name should be [Original source file name].txt e.g. The annotation of file "controller.c" should be called "controller.c.txt" The annotated file location in the annotated directory should match the associated source file location in the source directory. e.g. The annotation for source file "[SOURCE_DIR]/ subDir1/subDir2/controller.c" should be located in "[ANNOTATIONS_DIR]/subDir1/subDir2/controller.c.txt" The source and annotated directory are different. However, these directories can of course be identical, which ensures that locations of source and annotated files are the same.
- → Extension (ext , default: html) Specify the extension used by QAC to create annotated files.

The full command line syntax for MISRA Rule Checking with QAC is:

-d "type=QAC_MISRA,logDir=[text],ext=[text]"

13.39. Unit Test Status from Rational Test RealTime

13.39.1. Description

Rational Test RealTime is a cross-platform solution for component testing and runtime analysis of embedded software. This Data Provider extracts coverage results, as well as tests and their status

For more details, refer to http://www-01.ibm.com/software/awdtools/test/realtime/.

Note

RTRT can now create test artefacts in your project tree (new in 18.0)

13.39.2. Usage

Unit Test Status from Rational Test RealTime has the following options:

- .xrd folder (logDir) Specify the path to the folder containing the .xrd files generated by RTRT.
- → Excluded file extensions (excludedExtensions , default: .h;.H)
- → Generate Test artefacts and structure from .xrd files? (generateTests, default: false)

The full command line syntax for Unit Test Status from Rational Test RealTime is:

-d

"type=RTRT,logDir=[text],excludedExtensions=[text],generateTests=[booleanChoice]"

13.40. ReqIF

13.40.1. Description

RIF/ReqIF (Requirements Interchange Format) is an XML file format that can be used to exchange requirements, along with its associated metadata, between software tools from different vendors.

For more details, refer to http://www.omg.org/spec/ReqIF/.

13.40.2. Usage

ReqIF has the following options:

- →(dir)
- Spec Object Type (objType , default: _AUTO_) Specify the SPEC_OBJECT_TYPE property LONG-NAME to be used to process the ReqIf file. Using the _AUTO_ value will let the Data Provider extract the value fro the ReqIf file, and assumes that there is only one such definition.

The full command line syntax for ReqIF is:

-d "type=ReqIf,dir=[text],objType=[text]"

13.41. SQL Code Guard

13.41.1. Description

SQL Code Guard is a free solution for SQL Server that provides fast and comprehensive static analysis for T-Sql code, shows code complexity and objects dependencies.

For more details, refer to http://www.sqlcodeguard.com.

13.41.2. Usage

SQL Code Guard has the following options:

→ XML results (xml) Specify the path to the XML files containing SQL Code Guard results.

The full command line syntax for SQL Code Guard is:

```
-d "type=SQLCodeGuard,xml=[text]"
```

13.42. Squan Sources

13.42.1. Description

Squan Sources provides basic-level analysis of your source code.

For more details, refer to https://support.squoring.com.

Note

The analyser can output info and warning messages in the build logs. Recent additions to those logs include better handling of structures in C code, which will produce these messages:

- → [Analyzer] Unknown syntax declaration for function XXXXX at line yyy to indicate that we whould have found a function but, probably due to preprocessing directives, we are not able to parse it.
- → [Analyzer] Unbalanced () blocks found in the file. Probably due to preprocessing directives, parenthesis in the file are not well balanced.
- → [Analyzer] Unbalanced {} blocks found in the file. Probably due to preprocessing directives, curly brackets in the file are not well balanced.

Тір

You can specify the languages for your source code by passing pairs of language and extensions to the **languages** parameter. Extensions are case-sensitive and cannot be used for two different languages. For example, a project mixing php and javascript files can be analysed with:

--dp "type=SQuORE,languages=php:.php;javascript:.js,.JS"

In order to launch an analysis using all the available languages by default, do not specify the **languages** parameter in your command line.

13.42.2. Usage

Squan Sources has the following options:

- Languages (languages, default: ada;c;cpp;csharp;cobol;java;fortran77;fortran90;php;python;vbnet) Check the boxes for the languages used in the specified source repositories. Adjust the list of file extensions as necessary. Note that two languages cannot use the same file extension, and that the list of extensions is case-sensitive. Tip: Leave all the boxes unchecked and Squan Sources will auto-detect the language parser to use.
- Force full analysis (rebuild_all, default: false) Analyses are incremental by default. Check this box if you want to force the source code parser to analyse all files instead of only the ones that have changed since the previous analysis. This is useful if you added new rule files or text parsing rules and you want to re-evaluate all files based on your modifications.
- → Generate control graphs (genCG, default: true) This option allows generating a control graph for every function in your code. The control graph is visible in the dashboard of the function when the analysis completes.
- Use qualified names (qualified , default: false) Note: This option cannot be modified in subsequent runs after you create the first version of your project.
- Jimit analysis depth (depth , default: false) Use this option to limit the depth of the analysis to file-level only. This means that Squan Sources will not create any class or function artefacts for your project.
- Add a 'Source Code' node (scnode , default: false) Using this options groups all source nodes under a common source code node instead of directly under the APPLICATION node. This is useful if other data providers group non-code artefacts like tests or requirements together under their own top-level node. This option can only be set when you create a new project and cannot be modified when creating a new version of your project.
- Source Code' node label (scnode_name, default: Source Code) Specify a custom label for your main source code node. Note: this option is not modifiable. It only applies to projects where you use the "Add a 'Source Code' node" option. When left blank, it defaults to "Source Code".
- Compact folders (compact_folder , default: true) When using this option, folders with only one son are aggregates together. This avoids creating many unnecessary levels in the artefact tree to get to the first level of files in your project. This option cannot be changed after you have created the first version of your project.
- Content exclusion via regexp (pattern) Specify a PERL regular expression to automatically exclude files from the analysis if their contents match the regular expression. Leave this field empty to disable contentbased file exclusion.
- File Filtering (files_choice, default: Exclude) Specify a pattern and an action to take for matching file names. Leave the pattern empty to disable file filtering.
- pattern (pattern_files) Use a shell-like wildcard e.g. '*-test.c'. * Matches any sequence of characters in string, including a null string. ? Matches any single character in string. [chars] Matches any character in the set given by chars. If a sequence of the form x-y appears in chars, then any character between x and

:::::::: SQUORE

Getting Started Guide

y, inclusive, will match. On Windows, this is used with the -nocase option, meaning that the end points of the range are converted to lower case first. Whereas {[A-z]} matches '_' when matching case-sensitively ('_' falls between the 'Z' and 'a'), with -nocase this is considered like {[A-Za-z]}. \x Matches the single character x. This provides a way of avoiding the special interpretation of the characters *?[] in pattern. Tip: Use ; to separate multiple patterns.

- Folder Filtering (dir_choice , default: Exclude) Specify a pattern and an action to take for matching folder names. Leave the pattern empty to disable folder filtering.
- pattern (pattern_dir) Use a shell-like wildcard e.g. 'Test_*'. * Matches any sequence of characters in string, including a null string. ? Matches any single character in string. [chars] Matches any character in the set given by chars. If a sequence of the form x-y appears in chars, then any character between x and y, inclusive, will match. On Windows, this is used with the -nocase option, meaning that the end points of the range are converted to lower case first. Whereas {[A-z]} matches '_' when matching case-sensitively ('_' falls between the 'Z' and 'a'), with -nocase this is considered like {[A-Za-z]}. \x Matches the single character x. This provides a way of avoiding the special interpretation of the characters *?[] in pattern. Tip: Use ; to separate multiple patterns.
- Fxclude files whose size exceeds (size_limit , default: 500000) Provide the size in bytes above which files are excluded automatically from the Squore project (Big files are usually generated files or test files). Leave this field empty to deactivate this option.
- Detect algorithmic cloning (clAlg , default: true) When checking this box, Squan Sources launches a cloning detection tool capable of finding algorithmic cloning in your code.
- Detect text cloning (clTxt , default: true) When checking this box, Squan Sources launches a cloning detection tool capable of finding text duplication in your code.
- Ignore blank lines (clIgnBlk , default: true) When checking this box, blanks lines are ignored when searching for text duplication
- Ignore comment blocks (clignCmt , default: true) When checking this box, blocks of comments are ignored when searching for text duplication
- Minimum size of duplicated blocks (clRSlen , default: 10) This threshold defines the minimum size (number of lines) of blocks that can be reported as cloned.
- → Textual Cloning fault ratio (clFR , default: 0.1) This threshold defines how much cloning between two artefacts is necessary for them to be considered as clones by the text duplication tool. For example, a fault ratio of 0.1 means that two artefacts are considered clones if less than 10% of their contents differ.
- Algorithmic cloning fault ratio (clAlgFR, default: 0.1) This threshold defines how much cloning between two artefacts is necessary for them to be considered as clones by the algorithmic cloning detection tool.
- Compute Textual stability (genTs, default: true) This option allows keeping track of the stability of the code analysed for each version. The computed stability is available on the dashboard as a metric called and can be interpreted as 0% meaning completely changed and 100% meaning not changed at all.
- Compute Algorithmic stability (genAs, default: true) This option allows keeping track of the stability of the code analysed for each version. The computed stability is available on the dashboard as a metric called Stability Index (SI) and can be interpreted as 0% meaning completely changed and 100% meaning not changed at all.
- Detect artefact renaming (clRen, default: true) This option allows Squan Sources to detect artefacts that have been moved since the previous version, ensuring that the stability metrics of the previous artefact are passed to the new one. This is typically useful if you have moved a file to a different folder in your source tree and do not want to lose the previous metrics generated for this file. If you do not use this option, moved artefacts will be considered as new artefacts.
- Mark relaxed findings as suspicious (susp, default: MODIFIED_BEFORE) This option sets the suspicious flag on relaxed findings depending of the selected option. Applies on source code artifacts only.
- Additional parameters (additional_param) These additional parameters can be used to pass instructions to external processes started by this data provider. This value is generally left empty in most cases.

The full command line syntax for Squan Sources is:

"type=SQuORE,languages=[multipleChoice],rebuild_all=[booleanChoice],genCG=[booleanChoice],qua

13.43. Squore Import

13.43.1. Description

-d

Squore Import is a data provider used to import the results of another data provider analysis. It is generally only used for debugging purposes.

For more details, refer to https://support.squoring.com.

13.43.2. Usage

Squore Import has the following options:

> XML folder (inputDir) Specify the folder that contains the squore_data_*.xml files that you want to import.

The full command line syntax for Squore Import is:

-d "type=SQuOREImport,inputDir=[text]"

13.44. Squore Virtual Project

13.44.1. Description

Squore Virtual Project is a data provider that can use the output of several projects to compile metrics in a meta-project composed of the import sub-projects.

For more details, refer to https://support.squoring.com.

13.44.2. Usage

Squore Virtual Project has the following options:

Paths to output.xml files (output) Specify the paths to all the output.xml files you want to include in the virtual project. Separate paths using ';'.

The full command line syntax for Squore Virtual Project is:

-d "type=SQuOREVirtualProject,output=[text]"

13.45. StyleCop

13.45.1. Description

StyleCop is a C# code analysis tool. Its XML output is imported to generate findings.

For more details, refer to https://stylecop.codeplex.com/.

13.45.2. Usage

StyleCop has the following options:

→ XML results file (xml) Specify the path to the StyleCop XML results file. The minimum version compatible with this data provider is 4.7.

The full command line syntax for StyleCop is:

```
-d "type=StyleCop,xml=[text]"
```

13.46. StyleCop (plugin)

13.46.1. Description

StyleCop is a C# code analysis tool. Its XML output is imported to generate findings.

For more details, refer to https://stylecop.codeplex.com/.

Note

Note that this data provider is not supported on Linux. On windows, this data provider requires an extra download to extract the StyleCop binary in <SQUORE_HOME>/addons/tools/StyleCop_auto/ and .NET framework 3.5 to be installed on your machine (run Net.SF.StyleCopCmd.Console.exe manually once to install .NET automatically). For more information, refer to the Installation and Administration Guide's Third-Party Plugins and Applications [../install_admin_manual/index.html#sect_thirdparty_plugins] section.

13.46.2. Usage

StyleCop (plugin) has the following options:

Solution (sln) Specify the path to the .sln file to analyse. Leave empty to analyse all .sln found in the source repository.

The full command line syntax for StyleCop (plugin) is:

```
-d "type=StyleCop_auto,sln=[text]"
```

13.47. Tessy

13.47.1. Description

Tessy is a tool automating module/unit testing of embedded software written in dialects of C/C++. Tessy generates an XML results file which can be imported to generate metrics. This data provider supports importing files that have a xml_version="1.0" attribute in their header.

For more details, refer to https://www.hitex.com/en/tools/tessy/.

13.47.2. Usage

Tessy has the following options:

188

https://www.squoring.com/

Results folder (resultDir) Specify the top folder containing XML result files from Tessy. Note that this data provider will recursively scan sub-folders looking for index.xml files to aggregate results.

The full command line syntax for Tessy is:

```
-d "type=Tessy,resultDir=[text]"
```

13.48. VectorCAST

13.48.1. Description

The VectorCAST Data Provider extracts coverage results, as well as tests and their status

For more details, refer to https://www.vectorcast.com/.

Note

VectorCAST can now create test artefacts in your project tree (new in 18.0)

13.48.2. Usage

VectorCAST has the following options:

HTML Report (html_report) Specify the path to the HTML report which contains the test results.

\rightarrow Create test artefacts from HTML report (generateTests , default: false)

The full command line syntax for VectorCAST is:

-d "type=VectorCAST,html_report=[text],generateTests=[booleanChoice]"

13.49. CodeSniffer

13.49.1. Description

CodeSniffer is a rulecker for PHP and Javascript

For more details, refer to http://www.squizlabs.com/php-codesniffer.

13.49.2. Usage

CodeSniffer has the following options:

CodeSniffer results file (checkstyle formmated xml) (xml) Point to the XML file that contains CodeSniffer results.

The full command line syntax for CodeSniffer is:

-d "type=codesniffer,xml=[text]"

13.50. Configuration Checker

189

https://www.squoring.com/

13.50.1. Description

Use this tool to check for duplicated files or XML Elements between a custom configuration and the standard configuration.

13.50.2. Usage

Configuration Checker has the following options:

- \rightarrow Standard Configuration Path (s)
- → Custom Configurations Path (p)

The full command line syntax for Configuration Checker is:

-d "type=conf-checker,s=[text],p=[text]"

13.51. Csv Coverage Import

13.51.1. Description

Csv Coverage Import provides a generic import mechanism for coverage results at fnuction level

13.51.2. Usage

Csv Coverage Import has the following options:

→ CSV file (csv Enter the path to the CSV containing the coverage) data. The expected format each line the of contained in file is PATH;NAME;TESTED_C1;OBJECT_C1;TESTED_MCC;OBJECT_MCC;TESTED_MCDC;OBJECT_MCDC;TCOV_MCC;TCOV_MCC;TCOV_MCDC;TCOV

The full command line syntax for Csv Coverage Import is:

```
-d "type=csv_coverage,csv=[text]"
```

13.52. CSV Findings

13.52.1. Description

CSV Findings is a generic tool that allows importing findings into the project.

13.52.2. Usage

CSV Findings has the following options:

→ CSV File (csv) Specify the path to your CSV file containing findings. Each line in the file must use the following format and the file should include the following header: FILE;FUNCTION;RULE_ID;MESSAGE;LINE;COL;STATUS;STATUS_MESSAGE;TOOL

The full command line syntax for CSV Findings is:

```
-d "type=csv_findings,csv=[text]"
```

13.53. CSV Import

13.53.1. Description

Imports artefacts, metrics, findings, textual information and links from one or more CSV files. The expected CSV format for each of the input files is described in the user manuals in the csv_import framework reference.

Note

Consult csv_import Reference for more details about the expected CSV format.

13.53.2. Usage

CSV Import has the following options:

- Specify the CSV Separator (separator, default:;) Specify the CSV Separator used in the CSV file.
- SV Delimiter (delimiter , default: ") CSV Delimiter is used when the separator is used inside a cell value. If a delimiter is used as a char in a cell it has to be doubled. The ' char is not allowed as a delimiter.
- Artefact Path Separator (pathSeparator , default: /) Specify the character used as a separator in an artefact's path in the input CSV file.
- Case-sensitive artefact lookup (pathAreCaseSensitive , default: true) When this option is turned on, artefacts in the CSV file are matched with existing source code artefacts in a case-sensitive manner.
- Ignore source file path (ignoreSourceFilePath , default: false) When ignoring source file path it is your responsibility to ensure that file names are unique in the project.
- Create missing files (createMissingFile, default: false) Automatically creates the artefacts declared in the CSV file if they do not exist.
- Ignore finding if artefact not found (ignorelfArtefactNotFound, default: true) If a finding can not be attached to any artefact then it is either ignored (checked) or it is attached to the project node instead (unchecked).
- Unknown rule ID (unknownRuleId) For findings of a type that is not in your ruleset, set a default rule ID. The value for this parameter must be a valid rule ID from your analysis model.
- Measure ID for orphan artifacts count (orphanArteCountId) To save the total count of orphan findings as a metric at application level, specify the ID of the measure to use in your analysis model.
- Measure ID for unknown rules count (orphanRulesCountId) To save the total count of unknown rules as a metric at application level, Specify the ID of the measure to use in your analysis model.
- Information ID receiving the list of unknown rules IDs (orphanRulesListId) To save the list of unknown rule IDs as textual information at application level, specify the ID of the textual information to use in your analysis model.
- → CSV File (csv) Specify the path to the input CSV file containing artefacts, metrics, findings, textual information, links and keys.
- → Metrics CSV File (metrics) Specify the path to the CSV file containing metrics.
- → Infos CSV File (infos) Specify the path to the CSV file containing textual information.
- → Findings CSV File (findings) Specify the path to the CSV file containing findings.
- → Keys CSV File (keys) Specify the path to the CSV file containing artefact keys.
- Jinks CSV File (links) Specify the path to the CSV file containing links.
- Reports artefacts mapping problem as (level, default: info) When an artefact referenced in the csv file can not be found in the project, reports the problem as an information or as a warning.

The full command line syntax for CSV Import is:

191

https://www.squoring.com/

-d

"type=csv_import,separator=[text],delimiter=[text],pathSeparator=[text],pathAreCaseSensitive=

13.54. Csv Tag Import

13.54.1. Description

This data provider allows setting values for attributes in the project.

13.54.2. Usage

Csv Tag Import has the following options:

→ CSV file (csv) Specify the path to the file containing the metrics.

The full command line syntax for Csv Tag Import is:

-d "type=csv_tag_import,csv=[text]"

13.55. CPU Data Import

13.55.1. Description

CPU Data Import provides a generic import mechanism for CPU data from a CSV or Excel file.

Note

This Data Provider is new in Squore 18.0

13.55.2. Usage

CPU Data Import has the following options:

- (root_node, default: Resources)
- → Data File (xls_file) Specify the path to the file containing CPU information.
- Sheet Name (xls_sheetname) Specify the name of the Excel sheet that contains the CPU list.
- PU Column name (x1s_key) Specify the header name of the column which contains the CPU key.
- → Grouping Structure (xls_groups) Specify the headers for Grouping Structure, separated by ";".
- Filtering (xls_filters) Specify the list of Header for filtering For example: "column_name_1=regex1;column_name_2=regex2;

- → (cpu_idle_column_name, default: Average idle Time per loop [ms])
- (cpu_worst_column_name , default: Worse case idle Time per loop [ms])
- → (createOutput, default: true)

The full command line syntax for CPU Data Import is:

"type=import_cpu,root_node=[text],xls_file=[text],xls_sheetname=[text],xls_key=[text],xls_group

-d

192

13.56. Memory Data Import

13.56.1. Description

Memory Data Import provides a generic import mechanism for memory data from a CSV or Excel file.

Note

This Data Provider is new in Squore 18.0

13.56.2. Usage

Memory Data Import has the following options:

- → (root_node, default: Resources)
- Data File (xls_file) Specify the path to the file containing Memory information.
- Sheet Name (xls_sheetname) Specify the name of the Excel sheet that contains the Memory list.
- Memory Column name (xls_key) Specify the header name of the column which contains the Memory key.
- Grouping Structure (xls_groups) Specify the headers for Grouping Structure, separated by ";".
- Filtering (xls_filters) Specify the list of Header for filtering For example: "column_name_1=regex1;column_name_2=regex2;
- → (csv_separator, default:;)
- → (memory_size_column_name, default: Total)
- (memory_used_column_name , default: Used)
- → (memory_type_column_name, default: Type)
- → (createOutput , default: true)

The full command line syntax for Memory Data Import is:

```
"type=import_memory,root_node=[text],xls_file=[text],xls_sheetname=[text],xls_key=[text],xls_g
```

13.57. Stack Data Import

13.57.1. Description

Stack Data Import provides a generic import mechanism for stack data from a CSV or Excel file.

Note

-d

This Data Provider is new in Squore 18.0

13.57.2. Usage

Stack Data Import has the following options:

- i (root_node, default: Resources)
- Data File (xls_file) Specify the path to the file containing Stack information.
- Sheet Name (xls_sheetname) Specify the sheetname that contains the Stack list.

193

https://www.squoring.com/

© 2019 Squoring Technologies All rights reserved. This material may not be reproduced, displayed, modified or distributed without the express prior written permission of the copyright holder. Squore is protected by an Interdeposit Certification registered with Agence pour la Protection des Programmes under the Inter Deposit Digital Number IDDN.FR.001.390035.001.S.P.2013.000.10600.

- Stack Column name (xls_key) Specify the header name of the column which contains the Stack key.
- → Grouping Structure (xls_groups) Specify the headers for Grouping Structure, separated by ";".
- → Filtering (xls_filters) Specify the list of Header for filtering For example: "column_name_1=regex1;column_name_2=regex2;
- → (csv_separator, default:;)
- → (stack_size_column_name, default: Stack Size [Bytes])
- → (stack_average_column_name, default: Average Stack Size used [Bytes])
- (stack_worst_column_name, default: Worse Case Stack Size used [Bytes])
- → (createOutput, default: true)

The full command line syntax for Stack Data Import is:

"type=import_stack,root_node=[text],xls_file=[text],xls_sheetname=[text],xls_key=[text],xls_gr

13.58. Ticket Data Import

13.58.1. Description

Ticket Data Import provides a generic import mechanism for tickets from a CSV, Excel or JSON file. Additionnally, it generates findings when the imported tickets have an unknown status or type.

Note

-d

This Data Provider is new in Squore 18.0

This Data Provider provides fields so you can map all your tickets as Enhancements and defects and spread them over the following statuses: Open, In Implementation, In Verification, Closed. Overlapping statuses and types will cause an error, but if a ticket's type or status is not declared in the definition, the ticket will still be imported, and a finding will be created.

13.58.2. Usage

Ticket Data Import has the following options:

- → Root Node (root_node , default: Tickets) Specify the name of the node to attach tickets to.
- Data File (input_file) Specify the path to the CSV, Excel or JSON file containing tickets.
- Excel Sheet Name (xls_sheetname) Specify the sheet name that contains the ticket list if your import file is in Excel format.
- Ficket ID (artefact_id) Specify the header name of the column which contains the ticket ID.
- Ticket Name (artefact_name) Specify the pattern used to build the name of the ticket. The name can use any information collected from the CSV file as a parameter. Example: \${ID} : \${Summary}
- Ticket UID (artefact_uid) Specify the pattern used to build the ticket Unique ID. The UID can use any information collected from the CSV file as a parameter. Example: TK#\${ID}
- Grouping Structure (artefact_groups) Specify the headers for Grouping Structure, separated by ";". For example: "column_name_1=regex1;column_name_2=regex2;
- → Filtering (artefact_filters) Specify the list of Header for filtering For example: "column_name_1=regex1;column_name_2=regex2;
- Open Ticket Pattern (definition_open) Specify the pattern applied to define tickets as open. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=[Open|New]

- In Development Ticket Pattern (definition_rd_progress) Specify the pattern applied to define tickets as in development. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=Implementing
- Fixed Ticket Pattern (definition_vv_progress) Specify the pattern applied to define tickets as fixed. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=Verifying;Resolution=[fixed;removed]
- Closed Ticket Pattern (definition_close) Specify the pattern applied to define tickets as closed. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=Closed
- Defect Pattern (definition_defect) Specify the pattern applied to define tickets as defects. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Type=Bug
- Financement Pattern (definition_enhancement) Specify the pattern applied to define tickets as enhancements. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Type=Enhancement
- TODO Pattern (in_todo_list) Specify the pattern applied to include tickets in the TODO list. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Sprint=2018-23
- Creation Date Column (creation_date) Enter the name of the column containing the creation date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- Due Date Column (due_date) Enter the name of the column containing the due date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- Last Updated Date Column (last_updated_date) Enter the name of the column containing the last updated date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- Closure Date Column (closure_date) Enter the name of the column containing the closure date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- IRL (url) Specify the pattern used to build the ticket URL. The URL can use any information collected from the CSV file as a parameter. Example: https://example.com/bugs/\${ID}
- Description Column (description) Specify the header of the column containing the description of the ticket.
- → **Reporter Column (reporter)** Specify the header of the column containing the reporter of the ticket.
- → Handler Column (handler) Specify the header of the column containing the handler of the ticket.
- Priority Column (priority) Specify the header of the column containing priority data.
- → Severity Column (severity) Specify the header of the column containing severity data.
- → CSV Separator (csv_separator) Specify the character used in the CSV file to separate columns.
- Information Fields (informations) Specify the list of extra textual information to import from the CSV file. This parameter expects a list of headers separated by ";" characters. For example: Company;Country;Resolution
- → Save Output (createOutput)

The full command line syntax for Ticket Data Import is:

-d

"type=import_ticket,root_node=[text],input_file=[text],xls_sheetname=[text],artefact_id=[text]

13.59. Jira

13.59.1. Description

This Data Provider extracts tickets and their attributes from a Jira instance to create ticket artefacts in your project.

For more details, refer to https://www.atlassian.com/software/jira.

Note

This Data Provider is new in Squore 18.0

The extracted JSON from Jira is then passed to the Ticket Data Import Data Provider (described in Section 13.58, "Ticket Data Import"). Finer configuration of the data passed from this Data Provider to Ticket Data Import is available by editing (or overriding) <SQUORE_HOME>/addons/tools/jira/jira_config.xml.

13.59.2. Usage

Jira has the following options:

- Jira REST API URL (url, mandatory) The URL used to connect to yout Jira instance's REST API URL (e.g: https://jira.domain.com/rest/api/2)
- → Jira User login (login , mandatory) Specyfy your Jira User login.
- → Jira User password (pwd , mandatory) Specify your Jira User password.
- Number of queried tickets (max_results, mandatory, default:-1) Maximum number of queried tickets returned by the query (default is -1, meaning 'retrieve all tickets').
- Grouping Structure (artefact_groups, default: fields/components[0]/name) Specify the headers for Grouping Structure, separated by ";". For example: "column_name_1=regex1;column_name_2=regex2;
- Creation Date Field (creation_date, default: fields/created) Enter the name of the column containing the creation date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- Closure Date Field (closure_date , default: fields/resolutiondate) Enter the name of the column containing the closure date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- Due Date Field (due_date , default: fields/duedate) Enter the name of the column containing the due date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- Last Updated Date Field (last_updated_date, default: fields/updated) Enter the name of the column containing the last updated date of the ticket. For example: column_name{format="dd/mm/yyyy"}). If format is not specified, the following is used by default: dd/mm/yyyy.
- JQL Request (jql_request) Specify a JQL request (see JIRA documentation) in order to limit the number of elements sent by the JIRA server. For example: project=MonProjet.This parameter is optional.
- → Filtering (artefact_filters default: fields/issuetype/name=(Task|Bug|Improvement| New example: Feature)) Specify the list of Header for filtering For "column name 1=regex1;column name 2=regex2;
- Open Ticket Pattern (definition_open , default: fields/status/name=[To Do|Open|Reopened]) Specify the pattern applied to define tickets as open. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=[Open|New]

- In Development Ticket Pattern (definition_rd_progress , default: fields/status/name=[In Progress | In Review]) Specify the pattern applied to define tickets as in development. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=Implementing
- Fixed Ticket Pattern (definition_vv_progress , default: fields/status/name=[Verified]) Specify the pattern applied to define tickets as fixed. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=Verifying;Resolution=[fixed;removed]
- Closed Ticket Pattern (definition_close , default: fields/status/name=[Resolved|Closed|Done]) Specify the pattern applied to define tickets as closed. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Status=Closed
- Defect Pattern (definition_defect , default: fields/issuetype/name=[Bug]) Specify the pattern applied to define tickets as defects. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Type=Bug
- Enhancement Pattern (definition_enhancement , default: fields/issuetype/ name=[Improvement|New Feature]) Specify the pattern applied to define tickets as enhancements. This field accepts a regular expression to match one or more column headers with a list of possible values. Example: Type=Enhancement
- (in_todo_list, default: fields/status/name=.*)
- Information Fields (informations , default: fields/environment; fields/votes/votes) Specify the list of extra textual information to import from the CSV file. This parameter expects a list of headers separated by ";" characters. For example: Company; Country; Resolution

The full command line syntax for Jira is:

```
-d
```

```
"type=jira,url=[text],login=[text],pwd=[password],max_results=[text],artefact_groups=[text],cr
```

13.60. Mantis

13.60.1. Description

The Mantis Data Provider extracts tickets and their attributes from a Mantis installation and creates ticket artefacts. Prerequisites: This Data Provider queries Mantis tickets using the Mantis BT REST API. An API token is required to access this API. The Mantis server should be configured to avoid filtering 'Authorization' headers. See http://docs.php.net/manual/en/features.http-auth.php#114877 for further details.

For more details, refer to https://www.mantisbt.com.

Note

This Data Provider is new in Squore 18.0

The extracted JSON from Mantis BT is then passed to the Ticket Data Import Data Provider (described in Section 13.58, "Ticket Data Import"). Finer configuration of the data passed from this Data Provider to Ticket Data Import is available by editing (or overriding) <SQUORE_HOME>/addons/tools/mantis/mantis_config.xml.

13.60.2. Usage

Mantis has the following options:

Mantis URL (url, mandatory) Specify the URL of the Mantis instance (e.g: https://www.mantisbt.org/ bugs/api/rest)

- Mantis API Token (api_token, mandatory) Copy the Mantis API Token generated from your Account Settings in Mantis.
- Number of queried tickets (max_results, mandatory, default: 50) Maximum number of queried tickets returned by the query (default is 50. value=-1 means 'retrieve all tickets').

The full command line syntax for Mantis is:

```
-d "type=mantis,url=[text],api_token=[text],max_results=[text]"
```

13.61. OSLC

13.61.1. Description

OSLC-CM allows retrieving information from Change Management systems following the OSLC standard. Metrics and artefacts are created by connecting to the OSLC system and retrieving issues with the specified query.

For more details, refer to http://open-services.net/.

13.61.2. Usage

OSLC has the following options:

- Change Server (server) Specify the URL of the project you want to query on the OSLC server. Typically the URL will look like this: http://myserver:8600/change/oslc/db/3454a67f-656ddd4348e5/role/User/
- Query (guery) Specify the query to send to the OSLC server (e.g.: release="9TDE/TDE_00_01_00_00"). It is passed to the request URL via the ?oslc_cm.query= parameter.
- Query Properties (properties , default: request_type,problem_number,crstatus,severity,submission_area,functionality...) Specify the properties to add to the query. They are passed to the OSLC query URL using the ?oslc_cm.properties= parameter.
- → Login (login)
- Password (password)

The full command line syntax for OSLC is:

```
-d
"type=oslc_cm,server=[text],query=[text],properties=[text],login=[text],password=[password]"
```

13.62. pep8

13.62.1. Description

pep8 is a tool to check your Python code against some of the style conventions in PEP 88. Its CSV report file is imported to generate findings.

For more details, refer to https://pypi.python.org/pypi/pep8.

13.62.2. Usage

pep8 has the following options:

→ CSV results file (csv) Specify the path to the CSV report file created by pep8.

The full command line syntax for pep8 is:

-d "type=pep8,csv=[text]"

13.63. pycodestyle / pep8 (plugin)

13.63.1. Description

Style Guide for Python Code. Pep8 results are imported to produce findings on Python code. This data provider requires having pycodestyle or pep8 installed on the machine running the analysis and the pycodestyle or pep8 command to be available in the path. It is compatible with pycodestyle 2.4 or pep8 1.7 and may also work with older versions.

For more details, refer to https://pypi.org/project/pycodestyle.

13.63.2. Usage

pycodestyle / pep8 (plugin) has the following options:

→ Source code directory to analyse (dir) Leave this field empty to analyse all sources.

The full command line syntax for pycodestyle / pep8 (plugin) is:

```
-d "type=pep8_auto,dir=[text]"
```

13.64. PHP Code Coverage

13.64.1. Description

Library that provides collection, processing, and rendering functionality for PHP code coverage information.

For more details, refer to https://github.com/sebastianbergmann/php-code-coverage.

13.64.2. Usage

PHP Code Coverage has the following options:

Report Folder (html_report) Specify the path to the HTML report folder which contains the coverage results.

The full command line syntax for PHP Code Coverage is:

-d "type=phpcodecoverage,html_report=[text]"

13.65. pylint

13.65.1. Description

Pylint is a Python source code analyzer which looks for programming errors, helps enforcing a coding standard and sniffs for some code smells (as defined in Martin Fowler's Refactoring book). Pylint results are imported to generate findings for Python code.

For more details, refer to http://www.pylint.org/.

13.65.2. Usage

pylint has the following options:

→ CSV results file (csv) Specify the path to the CSV file containing pylint results. Note that the minimum version supported is 1.1.0.

The full command line syntax for pylint is:

-d "type=pylint,csv=[text]"

13.66. pylint (plugin)

13.66.1. Description

Coding Guide for Python Code. Pylint results are imported to produce findings on Python code. This data provider requires having pylint installed on the machine running the analysis and the pylint command to be available in the path. It is known to work with pylint 1.7.0 and may also work with older versions.

13.66.2. Usage

pylint (plugin) has the following options:

→ Source code directory to analyse (dir) Leave this field empty to analyse all sources.

The full command line syntax for pylint (plugin) is:

```
-d "type=pylint_auto,dir=[text]"
```

13.67. Qac_8_2

13.67.1. Description

QA-C is a static analysis tool for MISRA checking.

For more details, refer to http://www.programmingresearch.com/static-analysis-software/qac-qacpp-staticanalyzers/.

13.67.2. Usage

Qac_8_2 has the following options:

→ QAC output file (txt, mandatory) Specify the path to the .tab file to extract metrics from.

The full command line syntax for Qac_8_2 is:

-d "type=qac,txt=[text]"

13.68. Qac_8_2 CERT Import

13.68.1. Description

QA-C is a static analysis tool for MISRA and CERT checking.

200

https://www.squoring.com/

For more details, refer to http://www.programmingresearch.com/static-analysis-software/qac-qacpp-static-analyzers/.

13.68.2. Usage

Qac_8_2 CERT Import has the following options:

```
→ QAC CERT output file (.tab file) ( txt , mandatory)
```

The full command line syntax for Qac_8_2 CERT Import is:

```
-d "type=qac_cert,txt=[text]"
```

13.69. SonarQube

13.69.1. Description

This data provider imports findings from SonarQube. Note that versions prior to 6.2 may not be supported.

For more details, refer to https://www.sonarqube.org/.

Note

This Data Provider is new in Squore 18.0

13.69.2. Usage

SonarQube has the following options:

- SonarQube Location (sonar , default: http://127.0.0.1:9000) Specify the URL of the SonarQube installation to work with (for example: http://localhost:9000)
- \rightarrow SonarQube Component Key (key)
- Version Name (version)
- → Login(login)
- > Password (password)

The full command line syntax for SonarQube is:

-d

"type=sonarqube,sonar=[text],key=[text],version=[text],login=[text],password=[password]"

13.70. Adding More Languages to Squan Sources

Squan Sources can handle files written in languages that are not officially supported with a bit of extra configuration (new in 18.0). In this mode, only a basic analysis of the file is carried out so that an artefact is created in the project and findings can be attached to it. A subset of the base metrics from Squan Sources is optionally recorded for the artefact so that line counting, stability and text duplication metrics are available at file level for the new language.

The example below shows how you can add TypeScript files to your analysis:

- 1. Copy <SQUORE_HOME>/configuration/tools/SQuORE/form.xml and its .properties files into your own configuration
- 2. Edit form.xml to add a new language key and associated file extensions:

201

https://www.squoring.com/

```
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="SQuORE" ...>
<tag type="multipleChoice" key="languages" ...
defaultValue="...;typescript">
...
<value key="typescript" option=".ts,.TS" />
</tag>
</tags>
```

Files with extensions matching the **typescript** language will be added to your project as TYPESCRIPT_FILE artefacts

3. Edit the defaultValue of the additional_param field to specify how Squan Sources should count source code lines and comment lines in the new language, based on another language officially supported by Squore. This step is optional, and is only needed if you want the to record basic line counting metrics for the artefacts.

```
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="SQuORE" ...>
...
<tag type="text" key="additional_param"
defaultValue="typescript=javascript" />
...
</tags>
```

Lines in TypeScript files will be counted as they would for Javascript code.

4. Add translations for the new language key to show in the web UI in Squan Sources's form_en.properties

```
OPT.typescript.NAME=TypeScript
```

5. Add translations for the new artefact type in one of the properties files imported by your Description Bundle:

T.TYPESCRIPT_FILE.NAME=TypeScript File

6. The new artefact type should also be declared as a type in your model. The easiest way to do this is to add it to the **GENERIC_FILE** alias in your analysis model, which is pre-configured to record the line counting metrics for new artefacts. You should also define a root indicator for you new artefact type. The following snippet shows a minimal configuration using a dummy indicator:

```
<!-- <configuration>/MyModel/Analysis/Bundle.xml -->
<?xml version="1.0" encoding="UTF-8"?>
<Bundle>
...
<ArtefactType id="GENERIC_FILE" heirs="TYPESCRIPT_FILE" />
<RootIndicator artefactTypes="TYPESCRIPT_FILE" indicatorId="DUMMY" />
<Indicator indicatorId="DUMMY" scaleId="SCALE_INFO"
targetArtefactTypes="TYPESCRIPT_FILE" displayTypes="IMAGE" />
<Measure measureId="DUMMY">
<Computation targetArtefactTypes="TYPESCRIPT_FILE" result="0" />
</Measure>
...
</Bundle>
```

7. Reload your configuration and analyse a project, checking the box for TypeScript in Squan Sources's options to get Typescrypt artefacts in your project.

| Squan Sources |
|-----------------------------------|
|-----------------------------------|

| SQuAN Sources | | |
|---------------|------------------|---|
| Languages | ABAP | .abap,.ABAP |
| | 🖌 Ada | .adb,.ADB,.ada,.ADA,.ads,.ADS,.adi,.ADI |
| | <mark>√</mark> C | .c,.C |
| | ✓ C++ | .cpp,.CPP,.h,.H |
| | MindC | .mindc,.MINDC |
| | ✓ C# | .cs,.CS,.cscript,.CSCRIPT |
| | Cobol | .cbl,.CBL,.cob,.COB,.cbx,.CBX,.cpy,.CPY |
| | Java | .java, JAVA |
| | JavaScript | js,JS |
| | Fortran77 | .f, F, f77, F77, for, FOR |
| | Fortran90 | .f95,.F95,.f90,.F90,.f03,.F03,.f08,.F08 |
| | Objective-C | .m,.M,.mm,.MM,.c,.C,.h,.H |
| | PHP | .php,.PHP,.php5,.PHP5 |
| | PL/SQL | .sql, SQL |
| | Python | .py,.PY |
| | TSQL | .tsql,.TSQL |
| | TypeScript | .ts,.TS |
| | VB.NET | .vb,.VB |
| | Xaml | xami, XAML |

The new option for TypeScript files in Squan Sources

Тір

If you are launchin an analysis from the command line, use the language key defined in step 2 to analyse TypeScript files:

-d

"type=SQuORE,languages=typescript,additional_param=typescript=javascript"

- 8. After the analysis finishes and you can see your artefacts in the tree, use the Dashboard Editor to build a dashboard for your new artefact type.
- 9. Finally, create a handler for the source code viewer to display your new file type into your configuration folder, by copying <SQUORE_HOME>/configuration/sources/ javascript_file.properties into your own configuration as <SQUORE_HOME>/ configuration/sources/typescript_file.properties.

13.71. Advanced COBOL Parsing

By default, Squan Sources generates artefacts for all PROGRAMs in COBOL source files. It is possible to configure the parser to also generate artefacts for all SECTIONs and PARAGRAPHs in your source code. This feature can be enabled with the following steps:

- 1. Open <SQUORE_HOME>/configuration/tools/SQuORE/Analyzer/artifacts/ cobol/ArtifactsList.txt
- 2. Edit the list of artefacts to generate and add the section and paragraph types:

| program |
|-----------|
| section |
| paragraph |

3. Save your changes

If you create a new project, you will see the new artefacts straight away. For already-existing projects, make sure to launch a new analysis and check Squan Sources's **Force full analysis** option to parse the entire code again and generate the new artefacts.

13.72. Using Data Provider Input Files From Version Control

Input files for Squore's Data Providers, like source code, can be located in your version control system. When this is the case, you need to specify a variable in the input field for the Data Provider instead of an absolute path to the input file.

| Specify Repository Locations | | | | | | | | | | | |
|--|--------------|-----------|-------------------------|------------|---------------------------|--|-----------|-------|---|--|---|
| Folder | 🔿 Zip Upload | ClearCase | ⊖ Git ⊖ P Datapath * | | Perforce hare\samples\c\E | | ⊖ Synergy | ⊖ TFS | 0 | | 0 |
| | | | | | | | | | | | |
| Add repositor | | | | | | | | | | | |
| Select D | ata Provide | rs | | | | | | | | | |
| - Cppchee | ck | | | | | | | | | | |
| C# | | | | | | | | | | | |
| \sim | | | | | | | | | | | |
| | | Сррс | heck XML results | \$src\cppc | check.xml | | | | | | 0 |
| | | | | | | | | | | | |

A Data Provider using an input file extracted from a remote repository

The variable to use varies depending on your scenario:

- You have only one node of source code in your project In this case, the variable to use is \$src.
- → You have more than one node of source code in your project

In this case, you need to tell Squore in which node the input file is located. This is done using a variable that has the same name as the alias you defined for the source code node in the previous step of the wizard. For example, if your nodes are labelled Node1 and Node2 (the default names), then you can refer to them using the **\$Node1** and **\$Node2** variables.

Тір

When using these variables from the command line on a linux system, the \$ symbol must be escaped:

-d "type=PMD,configFile=\\$src/pmd_data.xml"

13.73. Providing a catalog file to a Data Provider for Offline XSL Transformations

When transforming an XML results file with an XSL stylesheet, the XML parser used by Squore will try to validate the XML file against the DTD declared in the XML header. In cases where the XSL transformation is running on a machine with no internet access, this can result in the execution of the Data Provider failing with a No route to host error message.

You can fix this issue by modifying the data provider to use a catalog file that will provide an alternate location for the DTD used to validate the XML. This feature can be used by all Data Providers that include an XSL transformation ¹.

The following example adds this functionality to the Cobertura Data Provider:

1. Add a catalog.xml file in the Data Provider's configuration folder:

```
<configuration>/tools/cobertura/catalog.xml:
<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
<rewriteSystem systemIdStartString="http://cobertura.sourceforge.net/xml"
rewritePrefix="./DTD"/>
</catalog>
```

2. Copy the dtd that the XML needs to validate again inside a DTD folder in <configuration>/tools/ cobertura/.

The catalog file will be used the next time the Data Provider is executed and the DTD declaration will dynamically be changed from:

<!DOCTYPE coverage SYSTEM "http://cobertura.sourceforge.net/xml/coverage-04.dtd">

to:

¹The list includes:

- → Cantata
- → Cobertura
- → CodeSonar
- → Coverity
- → CPD
- → CPPCheck
- → CPPTest
- → FindBugs
- → JaCoCo
- → Klocwork
- → NCover
- → Polyspace
- → sqlcodeguard

<!DOCTYPE coverage SYSTEM "<configuration>/tools/cobertura/DTD/ coverage-04.dtd">">

For more information about how to write your catalog file, refer to https://xerces.apache.org/xerces2-j/faq-xcatalogs.html.

13.74. Creating your own Data Providers and Repository Connectors

All Data Providers are utilities that run during an analysis. They usually take an input file to parse or parameters specified by the user to generate output files containing violations or metrics to add to your project. Here is a non-exhaustive list of what some of them do:

- → Use XSLT files to transform XML files
- → Read information from Microsoft Excel files
- → Parse HTML test results
- → Query web services
- → Export data from OSLC systems
- → Launch external processes

Repository Connectors are based on the same model and are used to specifically retrieve source code and other data from source code management systems.

Read on to learn about how to configure your Data Provider and make it available in the web interface, and then understand how to implement the scripted part of a Data Provider that is executed during an analysis.

The last part fo this section also introduces two frameworks that you can base your Data Providers on depending on whether you prefer to produce CSV or XML files for Squore.

13.74.1. Data Provider Parameters

A Data Provider's parameters are defined in a file called form.xml. The following is an example of form.xml for a Data Provider extending the GenericPerl framework:

customDP

| VORK | √ ux | usability |
|------------------------|----------|--------------|
| PROGRESS | 🗹 it | integration |
| | 🗸 ut | unit |
| ignore_missing_sources | | |
| input_file | myFile.x | nl |
| old_results | Exclude | le 🔿 Include |
| password * | | |

CustomDP parameters

```
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="GenericPerl" needSources="true" image="CustomDP.png"
projectStatusOnFailure="ERROR">
<tag type="multipleChoice" displayType="checkbox" optionTitle=" " key="tests">
 <value key="ux" option="usability" />
 <value key="it" option="integration" />
 <value key="ut" option="unit" />
</tag>
<tag type="booleanChoice" key="ignore_missing_sources" defaultValue="false" />
<tag type="text" key="input_file" defaultValue="myFile.xml" changeable="false" /
<tag type="multipleChoice" key="old_results" style="margin-left:10px"
displayType="radioButton" defaultValue="Exclude">
 <value key="Exclude" />
 <value key="Include" />
</tag>
<tag type="text" key="java_path" defaultValue="/usr/bin/java" hide="true" />
<tag type="password" required="true" key="password" />
</tags>
```

Tip

You can find the XML schema for form.xml in form.xsd.

The tags element accepts the following attributes:

- DaseName (mandatory if you are not using an exec-phase) indicates on which framework you are basing this Data Provider. The value of this attribute must match a folder from the addons folder of your installation.
- needSources (optional, default: false) allows specifying whether the Data Provider requires sources or not. When set to true, an error will be displayed if you try to select this Data Provider without adding any Repository Connector location to your project.
- image (optional, default: none) allows displaying a logo in the web UI for the Data Provider
- projectStatusOnFailure (optional, default: ERROR) defines what status the project ends in when this Data Provider produces an error. The following values are allowed:

- → IGNORE
- → WARNING
- → ERROR
- projectStatusOnWarning (optional, default: WARNING) defines what status the project ends in when this Data Provider produces a warning. The following values are allowed:
 - → IGNORE
 - → WARNING
 - → ERROR

Each tag element is a Data Provider option and allows the following attributes:

- * key (mandatory) is the option's key that will be passed to the perl script, or can be used to specify the parameter's value from the command line
- type (mandatory) defines the type of the parameter. The following values are accepted:
 - → text for free text entry
 - > password for password fields
 - > booleanChoice for a boolean
 - → multipleChoice for offering a selection of predefined values

Note

Predefined values are specified with a value element with a mandatory key attribute and an optional option attribute that allows modifying the value of the option from the UI. The input field for each option attribute is only displayed if the parent tag contains an optionTitle attribute.

- displayType (optional) allows specifying how to display a multipleChoice parameter by using one of:
 - → comboBox
 - → radioButton
 - > checkbox
- defaultValue (optional, default: empty) is the value used for the parameter when not specified
- hide (optional, default: false) allows hiding a parameter from the web UI, which is useful when combining it with a default value
- changeable (optional, default: true) allows making a parameter configurable only when creating the project but read-only for following analyses when set to true
- style (optional, default: empty) allows setting basic css for the attribute in the web UI
- required (optional, default: false) allows showing a red asterisk next to the field in the web UI to make it visibly required.

Tip

You can use a required tag of type **booleanchoice** to ensure that users must check a box in the web UI or set its value to *true* when building from the command line in order to proceed with the analysis (new in 18.0).

<tag type="booleanChoice" required="true" key="accept_privacy_policy" /

| Wizard Selection General Information Data Providers Rules Edition Confirmation | |

Clicking the Next button without checking a required checkbox displays an error

13.74.2. Localising your Data Provider

In order to display your Data Provider parameters in different languages in the web UI, yout Data Provider's form.xml does not contain any hard-coded strings. Instead, Squore uses each parameter's key attribute to dynamically retrieve a translation from a form_xx.properties file located next to form.xml.

When you create a Data Provider, it is mandatory to include at least an English version of the strings in a file called form_en.properties. You are free to add other languages as needed. Here is a sample .properties for for the CustomDP you created in the previous section:

```
FORM.GENERAL.NAME = CustomDP
FORM.DASHBOARD.NAME = Test Status
FORM.GENERAL.DESCR = CustomDP imports test results for my project
FORM.GENERAL.URL = http://example.com/CustomDP
TAG.tests.NAME = Test Types
TAG.tests.DESCR = Check the boxes next to the types of test results contained in
the results
TAG.ignore_missing_sources.NAME = Ignore Missing Sources
TAG.input_file.NAME = Test Results
TAG.input_file.DESCR = Specify the absolute path to the file containing the test
results
TAG.old_results.NAME = Old Test Results
TAG.old_results.DESCR = If the previous analysis contained results that are not
in this results file, what do you want to do with the old results?
OPT.Exclude.NAME = discard
OPT.Include.NAME = keep
TAG.password.NAME = File Password
TAG.password.DESCR = Specify the password to decrypt the test results file
```

The syntax for the .properties file is as follows:

→ FORM.GENERAL.NAME is the display name of the Data Provider in the project wizard

- → FORM.DASHBOARD.NAME is the display name of the Data Provider in the Explorer
- → FORM.GENERAL.DESCR is the description displayed in the Data Provider's tooltip in the web UI
- → FORM.GENERAL.URL is a reference URL for the Data Provider. Note that it is not displayed in ther web UI yet.
- → TAG.tag_name.NAME allows setting the display name of a parameter
- → TAG.tag_name.DESCR is a help text displayed in a tooltip next to the Data Provider option in the web UI
- OPT.option_name.NAME allows setting the display name of an option

Using the form_en.properties above for CustomDP results in the following being displayed in the web UI when launching an analysis:

| CustomDP | | | | |
|------------------------------|-------------------|--------------------------------------|----------|--|
| IN PROGRESS Test Types | ⊻ux ⊻it ⊻ut | usability integration unit |]] 8 | |
| Ignore Missing Sources | | | | If the previous analysis contained |
| Test Results | myFile.x | ml | 0 | results that are not in this results file, what do you want to do with |
| Old Test Results | | rd 🔿 keep | 0 | the old results? |
| File Password * | | | 0 | |
| CustomE | DP pulling | translations from a .properties file | | |

Тір

Not all wizards display all Data Providers by default. If your Data Provider does not appear after refreshing your configuration, make sure that your wizard bundle allows displaying all Data Providers by reviewing the tools element of Bundle.xml:

```
<?xml version="1.0" encoding="UTF-8"?>
<Bundle>
<Wizard ... >
...
<tools all="true">
...
</tools>
...
</Wizard>
</Bundle>
```

For more information about the wizard bundle, consult the the chapter called "Project Wizards" in the Configuration Guide.

If you have made this change and your Data Provider still does not appear in your wizard, consult the Validator to find out if it was disabled because of an error in its configuration.

| • | | | |

The General section of the Validator shows errors in your Data Providers

13.74.3. Running your Data Provider

Now that you have a new Data Provider available in the web interface (and the command line), this section will show you how to use these parameters and pass them to one or more scripts or executables in order to eventually write data in the format that Squore expects to import during the analysis.

At the end of a Data Provider execution, Squore expects a file named input-data.xml to be written in a specific location. The syntax of the XML file to generate is as follows:

```
<!-- input-data.xml syntax -->
<bundle version="2.0">
 <artifact [local-key=""] [local-parent=""|parent=""] >
        <artifact [id="<guid-stable-in-time-also-used-as-a-key>"]
name="Component" type="REQ" [location=""] >
  <info name | n="DESCR" value="The description of the object"/>
  <key value="3452-e89b-ff82"/>
  <metric name="TEST_KO" value="2"/>
  <finding name="AR120" loc="xxx" p0="The message" />
  <link name="TEST" local-src=""|local-dst=""|dst="" />
   <artifact id="" name="SubComponent" type="REQ">
   </artifact>
 </artifact>
 </artifact>
 <artifact id="" local-key="" name="" type="" local-parent=""|</pre>
parent="" [location=""] />
 . . .
 <link name="" local-src="" |src="" local-dst="" |dst="" />
 . . .
 <info local-ref="" | ref="" name="" value=""/>
 . . .
 <metric local-ref="" | ref="" name="" value=""/>
 . . .
 <finding local-ref="" [location=""] p0="" />
 <finding local-ref="" [location=""] p0="">
 <location local-ref="" [location=""] />
  <relax status="RELAXED_DEROGATION|RELAXED_LEGACY|RELAXED_FALSE_POSITIVE"><!</pre>
[CDATA[My Comment]]></relax>
```

</finding> ... </bundle>

Тір

You can find the XML schema for input-data.xml in input-data-2.xsd.

Your Data Provider is configured by adding an exec-phase element with a mandatory id="add-data" attribute in form.xml.

The basic syntax of an exec-phase can be seen below:

```
<exec-phase id="add-data">
<exec name="tcl|perl|java|javascript or nashorn" | executable="/path/to/bin"</pre>
executable="executable_name"failOnError="true|false" failOnStdErr="true|false"
warn="[WARN]" error="[ERROR|ERR]" fatal="[FATAL]">
 <arg value="${<function>(<args>)}"/>
 <arg value="-freeText" />
 <arg value="${<predefinedVars>}" />
 <arg value="versions" />
 <arg value="-myTag"/>
 <arg tag="myTag"/>
 <env key="MY_VAR" value="SOME_VALUE"/>
</exec>
<exec ... />
<exec-tool name="another_data_provider">
 <param key="<taqName>" value="<value>" />
 <param key="<tagName>" tag="<tag>" />
 <param ... />
</exec-tool>
<exec-tool ... >
  . . .
</exec-tool>
</exec-phase>
```

Executables

The exec-phase element accepts one or more launches of scripts or executables specified in an exec child element, that can receive arguments and environment variables specified via arg and env elements.

There are four built-in languages for executables:

- → tcl
- → perl
- → java
- → javascript or nashorn

The scripts are launched using the tcl, perl, or java runtimes defined in your Squore installation. This is also the case for javascript, which is handled by Java's Nashorn engine.

The following attributes of the exec element allow you to control error handling:

- failOnError (optional, default: true) marks the Data Provider execution as failed if the executable returns an error code
- failOnStdErr (optional, default: true) marks the Data Provider execution as failed if the executable prints something to stdErr during the execution

warn , error and fatal (optional, default: see code block above) allow you to define patterns to look for in the executable's standard output to fine-tune the result of the execution.

Other executables can be called, as long as they are available on the system's PATH, or configured in config.xml

Given the following config.xml:

git and python can be called in your Data Provider as follows:

```
<exec-phase id="add-data">
  <exec executable="git">
    ...
  </exec>
  <exec executable="python">
    ...
  </exec>
  </exec>
</exec></exec></pable>
```

Arguments

Argument values can be:

1. Free text passed in a value tag, useful to specify a parameter for your script

2. A tag key declared in form.xml passed as a tag attribute to retrieve the input specified by the user. If no input was specified, you can define a defaultValue :

```
<arg tag="maxValue" defaultValue="50" /> <arg tag="configFile" defaultValue="${getToolConfigDir(default.xml)}" />
```

- 3. One of the predefined functions
 - \${getOutputFile(<relative/path/to/file>,<abort of minutdata.xml file output by an exec-phase .failIfMissing is an optional boolean which aborts the execution when set to true if the file is missing.
 - \${getTemporaryFile(<relative/path/to/file>)} returns the absolute path of a temporary file created by an exec (only for add-data and repo-add-data phases)
 - \${getToolAddonsDir(<relative/path/to/file>)} returns the absolute path of a file in the Data Provider's addons folder
 - \${getToolConfigDir(<relative/path/to/file>)} returns the absolute path of a file in the Data Provider's configuration folder
 - \${path(<executable_name>)} returns the absolute path of an executable configured in config.xml, or just the executable name if the executable is available from the system's PATH.

Ref : SUM_Squore

```
<exec executable="...">
  <arg value="-git_path" />
  <arg value="${path(git)}" />
```

- 4. One of the predefined variables
 - \${tmpDirectory} to get an absolute path to a temp folder to create files
 - \${sourcesList} to get a list of the aliases and locations containing the data extracted by the repository connectors used in the analysis
 - \${outputDirectory} to get the absolute path of folder where the Data Provider needs to write the final input-data.xml

Calling Other Data Providers

You can call and pass parameters to other Data Providers after your exec-phase using an exec-tool element. The exec-tool element uses a mandatory name which is the name of the folder containing the other Data Provider to launch in your configuration folder and supports passing the parameters expected by the other Data Provider via one or more param elements where:

- > key is the name of the parameter expected by the other Data Provider (as defined in its form.xml)
- → **value** allows passing free text
- Itag allows passing the value of your own Data Provider's tag value to the other Data Provider and can be combined with a defaultValue attribute in case no value was specified by the user for the tag

As an example, the following Data Provider generates a CSV file that is then passed to the pep8 Data Provider:

```
<exec-phase id="add-data">
  <exec executable="python">
    <arg value="consolidate-reports-recursive.py" />
    <arg value="consolidate-reports-recursive.py" />
    <arg value="-folders" />
    <arg tag="root_folder" />
    <arg value="-outputFile" />
    <arg value="outputFile" />
    <arg value="output.csv" />
    </exec>
    <exec-tool name="pep8">
        <param key="csv" value="${getOutputFile(output.csv)}" />
        <param key="separator" tag="separator" defaultValue=";" />
        </exec-tool>
```

In this other example, a perl script is launched to retrieves issues from a ticketing system and the export data is passed to the **import_ticket** Data Provider:

```
<exec-phase id="add-data">
  <exec name="perl">
   <arg value="${getToolConfigDir(export_ticket.pl)}" />
   <arg value="-url" />
   <arg tag="url" />
   <arg tag="url" />
   <arg value="-login" />
   <arg tag="login" />
   <arg tag="pwd" />
   <arg value="-outputFile" />
   <arg value="${getOutputFile(exportdata.csv,false)}" />
  </exec>
  <exec-tool name="import_ticket">
   <param key="input_file" value="${getOutputFile(exportdata.csv)}" />
```

214

```
<param key="csv_separator" value=";" />
</exec-tool>
</exec-phase>
```

Тір

If your Data Provider uses a perl script, Squore provides a small library that makes it easy to retrieve script arguments called **SQuORE::Args**. Using it as part of your script, you can retrieve arguments using the **get_tag_value()** function, as shown below:

```
# name: export_ticket.pl
# description: exports issues to a CSV file
use SQuORE::Args;
# ...
# ...
my $url = get_tag_value("url");
my $login = get_tag_value("login");
my $pwd = get_tag_value("pwd");
my $outputFile = get_tag_value("outputFile");
# ...
exit 0;
```

Finding More Examples

If you want to find more examples of working Data Providers that use this syntax, check the following Data Providers in Squore's default configuration folder:

- → conf-checker calls a jar file to write an XML file in Squore's exchange format
- import_ticket parses a file to translate it into a format that can then be passed to csv_import to import the tickets into Squore
- → jira retrieves data from Jira and passes it to import_ticket

Creating Repository Connectors

The same syntax used to create Data Providers can be used to create Repository Connectors, and therefore instruct Squore to get source code from SCMs. Instead of using an exec-phase with the id="add-data", your Repository Connector should define the following phases:

id="import" defines how you extract source code and make it available to Squan Sources so it can be analysed. This phase is expected to return a path to a folder containing the sources to analyse or a data.properties file listing the path to the folder containing source and various other properties to be used in other executions:

```
directory=/path/to/sources-to-analyse
data.<keyl>=<valuel>
data.<key2>=<value2>
```

This phase is executed once per source code node in the project and allows you to use the following additional variables:

- \${outputSourceDirectory} is the folder containing the sources to analyse
- \${alias} is the alias used for the source code node (empty if there is only one source code node)
- id="repo-add-data" is similar to the add-data phase described for Data Providers in Section 13.74.3, "Running your Data Provider" and is expected to produce an input-data.xml. The only difference in the case of a Repository Connector is that this phase is executed once per source code node in the analysis.

> id="display" is the phase that is called when users request to view the source code for an artefact
from the web UI. This phase is expected to return a data.properties file with the following keys:

```
filePath=/path/to/source/file
displayPath=<Artefact Display Path (optional)>
```

The contents of filePath will be loaded in the source code viewer, while the value of displayPath will be used as the file path displayed in the header of the source code viewer.

This phase allows you to use the following additional variables:

- \${scalnfo} is text to display in the title bar of the source code viewer in the web interface
- \${artefactName} is the name of the file to display
- \${artefactPath} is the path (without the alias) of the file to display

During the **display** phase, you can retrieve any data set during the **import** phase for the repository using the **\${getImportData(<key1>)}** function

Тір

Consult SVN's form.xml in <SQUORE_HOME>/configuration/ repositoryConnectors/SVN for a working example of a Repository Connector that uses all the phases described above.

Using the Squore toolkit

If you want your Data Provider to use the Squore toolkit to retrieve references to artefacts, the following variables are available (in the add-data and repo-add-data phases only):

- → \${tclToolkitDirectory}: the directory of the toolkit tcl code to execute
- → \${squanOutputDirectory}: the directory of containing the results of the execution of Squan Sources

In order to use the toolkit, your exec must use the tcl language. As an example, here is a sample execphase and associated tcl file to get you started:

```
#repo-add-data.tcl:
set toolkitFile [lindex $argv 0]
set sqOutputDir [lindex $argv 1]
set outputDir [lindex $argv 2]
set xxx [lindex $argv 3]
# Initialise the toolkit
puts "Initializing toolkit"
source $toolkitFile
toolkit::initialize $sqOutputDir $outputDir
# Execute your code
```

216

```
# yout code here
# ...
# Generate xml files (artefacts)
puts "Generating xml files"
toolkit::generate $outputDir {artefacts}
```

13.74.4. Built-in Data Provider Frameworks

In order to help you import data into Squore, the following Data Provider frameworks are provided and can write a valid input-data.xml file for you:

1. csv_import (new in 18.0)

The csv_import framework allows you to write Data Providers that produce CSV files and then pass them on to the framework to be converted to an XML format that Squore understands. This framework allows you to import metrics, findings, textual information and links as well as generate your own artefacts. It is fully linked to the source code parser and therefore allows to locate existing source code artefacts generated by the source code parser (new in 18.0). Refer to the full csv_import Reference for more information.

2. **xml** (new in 18.0)

The xml framework is a sample implementation of a Data Provider that allows you to directly import an XML file or run it through an XSL transformation to that it matches the input format expected by Squore (input-data.xml). This framework therefore allows you to import metrics, findings, textual information and links as well as generate your own artefacts. Refer to the full xml Reference for more information.

Tip

If you are looking for the legacy Data Provider frameworks from previous versions of Squore, consult Section A.2, "Legacy Frameworks".

The legacy Data Provider frameworks are still supported, however using the new frameworks is recommended for developping new Data Providers, as they are more flexible and provide more functionality to interact with source code artefacts.

Appendix A. Data Provider Frameworks

A.1. Current Frameworks

The following Data Provider frameworks support importing all kinds of data into Squore. Whether you choose one or the other depends on the ability of your script or executable to produce CSV or XML data. Note that these frameworks are recommended over the legacy frameworks described in Section A.2, "Legacy Frameworks", which are deprecated as of Squore 18.0.18.

```
_____
= csv_import =
_____
The csv_import framework allows you to create Data Providers that produce CSV
files that the framework will translate into XML files that can be imported in
your analysts results. This framework is useful if writing XML files directly
from your script is not practical.
Using csv_import, you can import metrics, findings (including relaxed findings),
 textual information, and links between artefacts (including to and from source
code artefacts).
This framework replaces all the legacy frameworks that wrote CSV files in
previous versions.
Note that this framework can be called by your Data Provider simply by creating
an exec-tool phase that calls the part of the framework located in the
configuration folder:
<exec-tool name="csv_import">
<param key="csv" value="${getOutputFile(output.csv)}" />
<param key="separator" value=";" />
 <param key="delimiter" value="&quot;" />
</exec-tool>
For a full description of all the parameters that can be used, consult the
section called "CSV Import" in the "Data Providers" chapter of this manual.
______
= CSV format expected by the data provider =
_____
- Line to define an artefact (like a parent artefact for instance):

219

Keys line Information file accepts: Artefact definition line Information line Links file accepts: Artefact definition line Links line It is also possible to mix every kind of line in a single csv file, as long as each line is prefixed with the kind of data it contains. In this case, the first column must contain one of: DEFINE (or D): when the line is used to define an artefact METRIC (or M): to add a metric INFO (or I): to add an information KEY (or K): to add a key FINDING (or F): to add a finding, relaxed or not LINK (or L): to add link between artefacts The following is an example of a csv file containing mixed lines: D;\${artefact(CR_FOLDER,/CRsCl)} M;\${artefact(CR,/CRsCl/cr2727,2727)};NB;2 M;\${artefact(CR,/CRsCl/cr1010,1010)};NB;4 I;\${uid(1010)};NBI;Bad weather K;\${artefact(CR,/CRsCl/cr2727,2727)};#CR2727 I;\${artefact(CR,/CRsCl/cr2727,2727)};NBI;Nice Weather F;\${artefact(CR,/CRsCl/cr2727,2727)};BAD;Malformed M;\${uid(2727)};NB_EXT;3 I;\${uid(2727)};NBI_EXT;Another Info F; \${uid(2727)}; BAD_EXT; Badlyformed F; \${uid(2727)}; BAD_EXT1; Badlyformed1;; FALSE_POSITIVE; Everything is in the title]]> F;\${function(machine.c,41)};R_GOTO;"No goto; neither togo;";41 F;\${function(machine.c,42)};R_GOTO;No Goto;42;LEGACY;Was done a long time ago L;\${uid(1010)};CR2CR;\${uid(2727)} L; \$ {uid(2727) }; CR2CR; \$ {uid(1010) } _____ = xml = _____ The xml framework is an implementation of a data provider that allows to import an xml file, potentially after an xsl transformation. The transformed XML file is expected to follow the syntax expected by other data providers (see inputdata.xml specification). This framework can be extended like the other frameworks, by creating a folder for your data provider in your configuration/tools folder and creating a form.xml. Following are three examples of the possible uses of this framework. Example 1 - User enters an xml path and an xsl path, the xml is transformed using the xsl and then imported _____ <?xml version="1.0" encoding="UTF-8"?> <tags baseName="xml"> <tag type="text" key="xml" /> <tag type="text" key="xslt" />

```
<exec-phase id="add-data">
      <exec name="javascript" failOnError="true" failOnStdErr="true">
       <arg value="main.js" />
       <arg value="--" />
       <arg value="${outputDirectory}" />
       <arg tag="xml" />
        <arg tag="xslt" />
      </exec>
</exec-phase>
</tags>
Example 2 - The user enter an xml path, the xsl file is predefined (input-
data.xsl) and present in the same directory as form.xml
_____
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="xml">
 <tag type="text" key="xml" />
 <exec-phase id="add-data">
   <exec name="javascript" failOnError="true" failOnStdErr="true">
     <arg value="main.js" />
     <arg value="--" />
     <arg value="${outputDirectory}" />
     <arg tag="xml" />
     <arg value="${getToolConfigDir(input-data.xsl)}" />
    </exec>
 </exec-phase>
</tags>
Example 3 - The user enter an xml path of a file already in the expected format
_____
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="xml">
 <tag type="text" key="xml" />
 <exec-phase id="add-data">
   <exec name="javascript" failOnError="true" failOnStdErr="true">
     <arg value="main.js" />
     <arg value="--" />
     <arg value="${outputDirectory}" />
     <arg tag="xml" />
    </exec>
  </exec-phase>
```

* Not Supported

Legacy Data Provider frameworks and their capabilities

1. Csv

The Csv framework is used to import metrics or textual information and attach them to artefacts of type Application or File. While parsing one or more input CSV files, if it finds the same metric for the same artefact several times, it will only use the last occurrence of the metric and ignore the previous ones. Note that the type of artefacts you can attach metrics to is limited to Application and File artefacts. If you are working with File artefacts, you can let the Data Provider create the artefacts by itself if they do not exist already. Refer to the full Csv Reference for more information.

2. csv_findings

The csv_findings framework is used to import findings in a project and attach them to artefacts of type Application, File or Function. It takes a single CSV file as input and is the only framework that allows you to import relaxed findings directly. Refer to the full csv_findings Reference for more information.

3. CsvPerl

The CsvPerl framework offers the same functionality as Csv, but instead of dealing with the raw input files directly, it allows you to run a perl script to modify them and produce a CSV file with the expected input format for the Csv framework. Refer to the full CsvPerl Reference for more information.

4. FindingsPerl

The FindingsPerl framework is used to import findings and attach them to existing artefacts. Optionally, if an artefact cannot be found in your project, the finding can be attached to the root node of the project instead. When launching a Data Provider based on the FindingsPerl framework, a perl script is run first. This perl script is used to generate a CSV file with the expected format which will then be parsed by the framework. Refer to the full FindingsPerl Reference for more information.

5. Generic

The Generic framework is the most flexible Data Provider framework, since it allows attaching metrics, findings, textual information and links to artefacts. If the artefacts do not exist in your project, they will be created automatically. It takes one or more CSV files as input (one per type of information you want to import) and works with any type of artefact. Refer to the full Generic Reference for more information.

6. GenericPerl

The GenericPerl framework is an extension of the Generic framework that starts by running a perl script in order to generate the metrics, findings, information and links files. It is useful if you have an input file

whose format needs to be converted to match the one expected by the Generic framework, or if you need to retrieve and modify information exported from a web service on your network. Refer to the full GenericPerl Reference for more information.

7. ExcelMetrics

The ExcelMetrics framework is used to extract information from one or more Microsoft Excel files (.xls or .xslx). A detailed configuration file allows defining how the Excel document should be read and what information should be extracted. This framework allows importing metrics, findings and textual information to existing artefacts or artefacts that will be created by the Data Provider. Refer to the full ExcelMetrics Reference for more information.

After you choose the framework to extend, you should follow these steps to make your custom Data Provider known to Squore:

- 1. Create a new configuration tools folder to save your work in your custom configuration folder: MyConfiguration/configuration/tools.
- 2. Create a new folder for your data provider inside the new tools folder: **CustomDP**. This folder needs to contain the following files:
 - form.xml defines the input parameters for the Data Provider, and the base framework to use, as described in Section 13.74.1, "Data Provider Parameters"
 - form_en.properties contains the strings displayed in the web interface for this Data Provider, as described in Section 13.74.2, "Localising your Data Provider"
 - config.tcl contains the parameters for your custom Data Provider that are specific to the selected framework
 - CustomDP.pl is the perl script that is executed automatically if your custom Data Provider uses one of the *Perl frameworks.
- 3. Edit Squore Server's configuration file to register your new configuration path, as described in the Installation and Administration Guide.
- 4. Log into the web interface as a Squore administrator and reload the configuration.

Your new Data Provider is now known to Squore and can be triggered in analyses. Note that you may have to modify your Squore configuration to make your wizard aware of the new Data Provider and your model aware of the new metrics it provides. Refer to the relevant sections of the Configuration Guide for more information.

223

```
In order to import a single CSV file:
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="Csv" needSources="true">
<tag type="text" key="csv" defaultValue="/path/to/mydata.csv" />
</tags>
Notes:
- The csv key is mandatory.
- Since Csv-based data providers commonly rely on artefacts created by Squan
Sources, you can set the needSources attribute to force users to specify at
least one repository connector when creating a project.
In order to import all files matching a pattern in a folder:
_____
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="Csv" needSources="true">
<!-- Root directory containing Csv files to import-->
 <tag type="text" key="dir" defaultValue="/path/to/mydata" />
 <!-- Pattern that needs to be matched by a file name in order to import it-->
 <tag type="text" key="ext" defaultValue="*.csv" />
 <!-- search for files in sub-folders -->
 <tag type="booleanChoice" defaultValue="true" key="sub" />
</tags>
Notes:
- The dir and ext keys are mandatory
- The sub key is optional (and its value set to false if not specified)
_____
= config.tcl =
_____
Sample config.tcl file:
_____
# The separator used in the input CSV file
# Usually t \text{ or };
set Separator "\t"
# The delimiter used in the input CSV file
# This is normally left empty, except when you know that some of the values in
the CSV file
# contain the separator itself, for example:
# "A text containing ; the separator";no problem;end
# In this case, you need to set the delimiter to \" in order for the data
provider to find 3 values instead of 4.
# To include the delimiter itself in a value, you need to escape it by
duplicating it, for example:
# "A text containing "" the delimiter"; no problemo; end
# Default: none
set Delimiter \"
# ArtefactLevel is one of:
      Application: to import data at application level
#
      File: to import data at file level. In this case ArtefactKey has to be set
#
             to the value of the header (key) of the column containing the file
path
     in the input CSV file.
#
```

Function : to import data at function level, in this case: ArtefactKey has to be set to the value of the header (key) of the column containing the path of the file FunctionKey has to be set to the value of the header (key) of the column containing the name and signature of the function # Note that the values are case-sensitive. set ArtefactLevel File set ArtefactKey File # Should the File paths be case-insensitive? # true or false (default) # This is used when searching for a matching artefact in already-existing artefacts. set PathsAreCaseInsensitive "false" # Should file artefacts declared in the input CSV file be created automatically? # true (default) or false set CreateMissingFile "true" # FileOrganisation defines the layout of the input CSV file and is one of: # header::column: values are referenced from the column header header::line: NOT AVAILABLE # # alternate::line: lines are a sequence of {Key Value} alternate::column: columns are a sequence of {Key Value} # # There are more examples of possible CSV layouts later in this document set FileOrganisation header::column # Metric2Key contains a case-sensitive list of paired metric IDs: {MeasureID KeyName [Format]} # # where: - MeasureID is the id of the measure as defined in your analysis model - KeyName, depending on the FileOrganisation, is either the name of the column or the name in the cell preceding the value to import as found in the input CSV file # # - Format is the optional format of the data, the only accepted format # is "text" to attach textual information to an artefact, for normal metrics omit this field set Metric2Key { {BRANCHES Branchs} {VERSIONS Versions} {CREATED Created} {IDENTICAL Identical} {ADDED Added} {REMOV Removed} {MODIF Modified} {COMMENT Comment text} = Sample CSV Input Files = _____ Example 1: =========== FileOrganisation : header::column ArtefactLevel : File ArtefactKey : Path

Working With Paths:
_____
- Path seperators are unified: you do not need to worry about handling
differences between Windows and Linux
```

226

- With the option PathsAreCaseInsensitive, case is ignored when searching for files in the Squore internal data - Paths known by Squore are relative paths starting at the root of what was specified in the repository connector durign the analysis. This relative path is the one used to match with a path in a csv file. Here is a valid example of file matching: 1. You provide C:\A\B\C\D as the root folder in a repository connector 2. C:\A\B\C\D contains E\e.c then Squore will know E/e.c as a file 3. You provide a csv file produced on linux and containing /tmp/X/Y/E/e.c as path, then Squore will be able to match it with the known file. Squore uses the longest possible match. In case of conflict, no file is found and a message is sent to the log. _____ = csv_findings = _____ The csv_findings data provider is used to import findings (rule violations) and attach them to artefacts of type Application, File or Function. The format of the csv file given as parameter has to be: FILE; FUNCTION; RULE_ID; MESSAGE; LINE; COL; STATUS; STATUS_MESSAGE; TOOL where: ===== FILE : is the full path of the file where the finding is located FUNCTION : is the name of the function where the finding is located RULE_ID : is the Squore ID of the rule which is violated MESSAGE : is the specific message of the violation LINE: is the line number where the violation occurs COL: (optional, leave empty if not provided) is the column number where the violation occurs STATUS: (optional, leave empty if not provided) is the staus of the relaxation if the violation has to be relaxed (DEROGATION, FALSE POSITIVE, LEGACY) STATUS_MSG: (optional, leave empty if not provided) is the message for the relaxation when relaxed TOOL: is the tool providing the violation The header line is read and ignored (it has to be there) The separator (semicolon by default) can be changed in the config.tcl file (see below) The delimiter (no delimiter by default) can be changed in the config.tcl (see below) _____ = config.tcl = _____ Sample config.tcl file: _____ # The separator used in the input CSV file # Usually ; or tset Separator \setminus ; # The delimiter used in the CSV input file

This is normally left empty, except when you know that some of the values in the CSV file # contain the separator itself, for example: # "A text containing ; the separator";no problem;end # In this case, you need to set the delimiter to " in order for the data provider to find 3 values instead of 4. # To include the delimiter itself in a value, you need to escape it by duplicating it, for example: # "A text containing "" the delimiter"; no problemo; end # Default: none set Delimiter \" ============ = CsvPerl = ============ The CsvPerl framework offers the same functionality as Csv, but instead of dealing with the raw input files directly, it allows you to run a perl script to modify them and produce a CSV file with the expected input format for the Csv framework. _____ = form.xml = ================ In your form.xml, specify the input parameters you need for your Data Provider. Our example will use two parameters: a path to a CSV file and another text parameter: <?xml version="1.0" encoding="UTF-8"?> <tags baseName="CsvPerl" needSources="true"> <tag type="text" key="csv" defaultValue="/path/to/csv" /> <tag type="text" key="param" defaultValue="MyValue" /> </tags> - Since Csv-based data providers commonly rely on artefacts created by Squan Sources, you can set the needSources attribute to force users to specify at least one repository connector when creating a project. _____ = config.tcl = _____ Refer to the description of config.tcl for the Csv framework. For CsvPerl one more option is possible: # The variable NeedSources is used to request the perl script to be executed once for each # repository node of the project. In that case an additional parameter is sent to the # perl script (see below for its position) #set ::NeedSources 1 ------

= Sample CSV Input Files = Refer to the examples for the Csv framework. _____ = Perl Script = _____ The perl scipt will receive as arguments: - all parameters defined in form.xml (as -\${key} \$value) - the input directory to process (only if :: NeedSources is set to 1 in the config.tcl file) - the location of the output directory where temporary files can be generated - the full path of the csv file to be generated For the form.xml we created earlier in this document, the command line will be: perl <configuration_folder>/tools/CustomDP/CustomDP.pl -csv /path/to/csv -param MyValue <output_folder> <output_folder>/CustomDP.csv Example of perl script: _____ #!/usr/bin/perl use strict; use warnings; \$ | =1 ; (\$csvKey, \$csvValue, \$paramKey, \$paramValue, \$output_folder, \$output_csv) = @ARGV; # Parse input CSV file # ... # Write results to CSV open(CSVFILE, ">" . \${output_csv}) || die "perl: can not write: \$!\n"; binmode(CSVFILE, ":utf8"); print CSVFILE "ChangeRequest;15"; close CSVFILE; exit 0; _____ = Generic = _____ The Generic framework is the most flexible Data Provider framework, since it allows attaching metrics, findings, textual information and links to artefacts. If the artefacts do not exist in your project, they will be created automatically. It takes one or more CSV files as input (one per type of information you want to import) and works with any type of artefact. _____ = form.xml = In form.xml, allow users to specify the path to a CSV file for each type of data you want to import.

You can set needSources to true or false, depending on whether or not you want to require the use of a repository connector when your custom Data Provider is used. Example of form.xml file: _____ <?xml version="1.0" encoding="UTF-8"?> <tags baseName="Generic" needSources="false"> <!-- Path to CSV file containing Metrics data --> <tag type="text" key="csv" defaultValue="mydata.csv" /> <!-- Path to CSV file containing Findings data: --> <tag type="text" key="fdg" defaultValue="mydata_fdg.csv" /> <!-- Path to CSV file containing Information data: --> <tag type="text" key="inf" defaultValue="mydata_inf.csv" /> <!-- Path to CSV file containing Links data: --> <tag type="text" key="lnk" defaultValue="mydata_lnk.csv" /> </tags> Note: All tags are optional. You only need to specify the tag element for the type of data you want to import with your custom Data Provider. _____ = config.tcl = _____ Sample config.tcl file: _____ # The separator used in the input csv files # Usually \t or ; or , # In our example below, a space is used. set Separator " " # The delimiter used in the input CSV file # This is normally left empty, except when you know that some of the values in the CSV file # contain the separator itself, for example: # "A text containing ; the separator"; no problem; end # In this case, you need to set the delimiter to " in order for the data provider to find 3 values instead of 4. # To include the delimiter itself in a value, you need to escape it by duplicating it, for example: # "A text containing "" the delimiter"; no problemo; end # Default: none set Delimiter \" # The path separator in an artefact's path # in the input CSV file. # Note that artefact is spellt with an "i" # and not an "e" in this option. set ArtifactPathSeparator "/' # If the data provider needs to specify a different toolName (optional) set SpecifyToolName 1 # Metric2Key contains a case-sensitive list of paired metric IDs: # {MeasureID KeyName [Format]} # where: - MeasureID is the id of the measure as defined in your analysis model #

```
- KeyName is the name in the cell preceding the value to import as found in
the input CSV file
    - Format is the optional format of the data, the only accepted format
      is "text" to attach textual information to an artefact. Note that the same
result can also
       be achieved with Info2Key (see below). For normal metrics omit this
field.
set Metric2Key {
 {CHANGES Changed}
# Finding2Key contains a case-sensitive list of paired rule IDs:
     {FindingID KeyName}
#
#
 where:
#
    - FindingID is the id of the rule as defined in your analysis model
   - KeyName is the name in the finding name in the input CSV file
set Finding2Key {
{R_NOTLINKED NotLinked}
# Info2Key contains a case-sensitive list of paired info IDs:
#
      {InfoID KeyName}
#
 where:
  - InfoID is the id of the textual information as defiend in your analysis
#
model
   - KeyName is the name of the information name in the input CSV file
set Info2Key
 {SPECIAL_LABEL Label}
# Ignore findings for artefacts that are not part of the project (orphan
findings)
# When set to 1, the findings are ignored
# When set to 0, the findings are imported and attached to the APPLICATION node
# (default: 1)
set IgnoreIfArtefactNotFound 1
# If data in csv concerns source code artefacts (File, Class or Function), the
way to
# match file paths can be case-insensitive
# true or false (default)
# This is used when searching for a matching artefact in already-existing
artefacts.
set PathsAreCaseInsensitive "false"
# For findings of a type that is not in your ruleset, set a default rule ID.
# The value for this parameter must be a valid rule ID from your analysys model.
# (default: empty)
set UnknownRuleId UNKNOWN_RULE
# Save the total count of orphan findings as a metric at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanArteCountId NB_ORPHANS
# Save the total count of unknown rules as a metric at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
```

```
# (default: empty)
set OrphanRulesCountId NB_UNKNOWN_RULES
# Save the list of unknown rule IDs as textual information at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanRulesListId UNKNOWN_RULES_INFO
_____
= CSV File Format =
_____
All the examples listed below assume the use of the following config.tcl:
set Separator ","
set ArtifactPathSeparator "/"
set Metric2Key {
{CHANGES Changed}
}
set Finding2Key {
 {R_NOTLINKED NotLinked}
set Info2Kev
{SPECIAL_LABEL Label}
}
How to reference an artefact:
_____
==> artefact_type artefact_path
Example:
REQ_MODULES, Requirements
REQ_MODULE, Requirements/Module
REQUIREMENT, Requirements/Module/My_Req
References the following artefact
Application
     Requirements (type: REQ_MODULES)
  Module (type: REQ_MODULE)
   My_Req (type: REQUIREMENT)
Note: For source code artefacts there are 3 special artefact kinds:
 ==> FILE file_path
==> CLASS file_path (Name Line)
==> FUNCTION file_path (Name Line)
Examples:
FUNCTION src/file.c 23
references the function which contains line 23 in the source file src/file.c, if
no
function found the line whole line of the csv file is ignored.
FUNCTION src/file.c foo()
references a function named foo in source file src/file.c. If more than one
function foo
is defined in this file, then the signature of the function (which is optional)
is used
to find the best match.
```

Layout for Metrics File: _____ ==> artefact_type artefact_path (Key Value)* When the parent artefact type is not given it defaults to <artefact_type>_FOLDER. Example: REQ_MODULE, Requirements/Module REQUIREMENT, Requirements/Module/My_Req, Changed, 1 will produce the following artefact tree: Application Requirements (type: REQ_MODULE_FOLDER) Module (type: REQ_MODULE) My_Req : (type: REQUIREMENT) with 1 metric CHANGES = 1 Note: the key "Changed" is mapped to the metric "CHANGES", as specified by the Metric2Key parameter, so that it matches what is expected by the model. Layout for Findings File: _____ ==> artefact_type artefact_path key message When the parent artefact type is not given it defaults to <artefact_type>_FOLDER. Example: REQ_MODULE, Requirements/Module REQUIREMENT, Requirements/Module/My_Req, NotLinked, A Requiremement should always been linked will produce the following artefact tree: Application Requirements (type: REQ_MODULE_FOLDER) Module (type: REQ_MODULE) My_Req (type: REQUIREMENT) with 1 finding R_NOTLINKED whose description is "A Requiremement should always been linked" Note: the key "NotLinked" is mapped to the finding "R_NOTLINKED", as specified by the Finding2Key parameter, so that it matches what is expected by the model. Layout for Textual Information File: _____ ==> artefact_type artefact_path label value When the parent artefact type is not given it defaults to <artefact_type>_FOLDER. Example: REQ_MODULE, Requirements/Module REQUIREMENT, Requirements/Module/My_Req, Label, This is the label of the req will produce the following artefact tree: Application Requirements (type: REQ_MODULE_FOLDER) Module (type: REQ_MODULE) My_Req (type: REQUIREMENT) with 1 information of type SPECIAL_LABEL whose content is "This is the label of the req"

Note: the label "Label" is mapped to the finding "SPECIAL_LABEL", as specified by the Info2Key parameter, so that it matches what is expected by the model. Layout for Links File: _____ ==> artefact_type artefact_path dest_artefact_type dest_artefact_path link_type When the parent artefact type is not given it defaults to <artefact_type>_FOLDER Example: REQ_MODULE Requirements/Module TEST_MODULE Tests/Module REQUIREMENT Requirements/Module/My_Req TEST Tests/Module/My_test TESTED_BY will produce the following artefact tree: Application Requirements (type: REQ_MODULE_FOLDER) Module (type: REQ_MODULE) My_Req (type: REQUIREMENT) ----> Tests (type: TEST_MODULE_FOLDER) Module (type: TEST_MODULE) My_Test (type: TEST) <----+ link (type: TESTED_BY) The TESTED_BY relationship is created with My_Req as source of the link and My_test as the destination CSV file organisation when SpecifyToolName is set to 1 _______ When the variable SpecifyToolName is set to 1 (or true) a column has to be added at the beginning of each line in each csv file. This column can be empty or filled with a different toolName. Example: ,REQ_MODULE,Requirements/Module MyRegChecker, REQUIREMENT, Requirements/Module/My_Reg Label, This is the label of the req The finding of type Label will be set as reported by the tool "MyReqChecker". _____ = GenericPerl = _____ The GenericPerl framework is an extension of the Generic framework that starts by running a perl script in order to generate the metrics, findings, information and links files. It is useful if you have an input file whose format needs to be converted to match the one expected by the Generic framework, or if you need to retrieve and modify information exported from a web service on your network. _____ = form.xml = _____ In your form.xml, specify the input parameters you need for your Data Provider. 234

<tag type="text" key="csv" defaultValue="/path/to/csv" /> <tag type="text" key="param" defaultValue="MyValue" /> </tags> _____ = config.tcl = _____ Refer to the description of config.tcl for the Generic framework for the basic options. Additionally, the following options are available for the GenericPerl framework, in order to know which type of information your custom Data Provider should try to import. # If the data provider needs to specify a different toolName (optional) #set SpecifyToolName 1 # Set to 1 to import metrics csv file, 0 otherwise # ImportMetrics # When set to 1, your custom Data Provider (CustomDP) will try to import # metrics from a file called CustomDP.mtr.csv that your perl script # should generate according to the expected format described in the # documentation of the Generic framework. set ImportMetrics 1 # ImportInfos # When set to 1, your custom Data Provider (CustomDP) will try to import # textual information from a file called CustomDP.inf.csv that your perl script # should generate according to the expected format described in the # documentation of the Generic framework. set ImportInfos 0 # ImportFindings # When set to 1, your custom Data Provider (CustomDP) will try to import # findings from a file called CustomDP.fdg.csv that your perl script # should generate according to the expected format described in the # documentation of the Generic framework. set ImportFindings 1 # ImportLinks # When set to 1, your custom Data Provider (CustomDP) will try to import # artefact links from a file called CustomDP.lnk.csv that your perl script # should generate according to the expected format described in the # documentation of the Generic framework. set ImportLinks 0 # Ignore findings for artefacts that are not part of the project (orphan findings) # When set to 1, the findings are ignored # When set to 0, the findings are imported and attached to the APPLICATION node # (default: 1) set IgnoreIfArtefactNotFound 1 # For findings of a type that is not in your ruleset, set a default rule ID. # The value for this parameter must be a valid rule ID from your analysys model. # (default: empty)

set UnknownRuleId UNKNOWN_RULE

```
# Save the total count of orphan findings as a metric at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanArteCountId NB_ORPHANS
# Save the total count of unknown rules as a metric at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanRulesCountId NB_UNKNOWN_RULES
# Save the list of unknown rule IDs as textual information at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanRulesListId UNKNOWN_RULES_INFO
_____
= CSV File Format =
_____
Refer to the examples in the Generic framework.
_____
= Perl Script =
_____
The perl scipt will receive as arguments:
- all parameters defined in form.xml (as -${key} $value)
 the location of the output directory where temporary files can be generated
 the full path of the metric csv file to be generated (if ImportMetrics is set
to 1 in config.tcl)
 the full path of the findings csv file to be generated (if ImportFindings is
set to 1 in config.tcl)
 the full path of the textual information csv file to be generated (if
ImportInfos is set to 1 in config.tcl)
 the full path of the links csv file to be generated (if ImportLinks is set to 1
in config.tcl)
- the full path to the output directory used by this data provider in the
previous analysis
For the form.xml and config.tcl we created earlier in this document, the command
line will be:
perl <configuration_folder>/tools/CustomDP/CustomDP.pl -csv /path/to/csv -
param MyValue <output_folder> <output_folder>/CustomDP.mtr.csv <output_folder>/
CustomDP.fdg.csv <previous_output_folder>
The following perl functions are made available in the perl environment so you
can use them in your script:
- get_tag_value(key) (returns the value for $key parameter from your form.xml)
- get_output_metric()
- get_output_finding()
- get_output_info()
- get_output_link()
- get_output_dir()
```

```
- get_input_dir() (returns the folder containing sources if needSources is set to
1)
- get_previous_dir()
Example of perl script:
#!/usr/bin/perl
use strict;
use warnings;
$|=1 ;
# Parse input CSV file
my $csvFile = get_tag_value("csv");
my $param = get_tag_value("param");
 # ...
 # Write metrics to CSV
open(METRICS_FILE, ">" . get_output_metric()) || die "perl: can not write: $!
\n";
binmode(METRICS_FILE, ":utf8");
print METRICS_FILE "REQUIREMENTS; Requirements/All_Requirements; NB_REQ; 15";
close METRICS_FILE;
# Write findings to CSV
open(FINDINGS_FILE, ">" . get_output_findings()) || die "perl: can not write: $!
\n";
binmode(FINDINGS_FILE, ":utf8");
print FINDINGS_FILE "REQUIREMENTS; Requirements/All_Requirements; R_LOW_REQS;
\"The minimum number of requirement should be at least 25.\"";
close FINDINGS_FILE;
exit 0;
_____
= FindingsPerl =
_____
The FindingsPerl framework is used to import findings and attach them to existing
artefacts. Optionally, if an artefact cannot be found in your project, the
finding can be attached to the root node of the project instead. When launching
a Data Provider based on the FindingsPerl framework, a perl script is run first.
This perl script is used to generate a CSV file with the expected format which
will then be parsed by the framework.
_____
= form.xml =
In your form.xml, specify the input parameters you need for your Data Provider.
Our example will use two parameters: a path to a CSV file and another text
parameter:
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="CsvPerl" needSources="true">
<tag type="text" key="csv" defaultValue="/path/to/csv" />
<tag type="text" key="param" defaultValue="MyValue" />
</tags>
```

Since FindingsPerl-based data providers commonly rely on artefacts created by Squan Sources, you can set the needSources attribute to force users to specify at least one repository connector when creating a project. = config.tcl = _____ Sample config.tcl file: _____ # The separator to be used in the generated CSV file # Usually t or ;set Separator ";" # The delimiter used in the input CSV file # This is normally left empty, except when you know that some of the values in the CSV file # contain the separator itself, for example: "A text containing ; the separator"; no problem; end # In this case, you need to set the delimiter to " in order for the data provider to find 3 values instead of 4. # To include the delimiter itself in a value, you need to escape it by duplicating it, for example: # "A text containing "" the delimiter"; no problemo; end # Default: none set Delimiter \" # Should the perl script execcuted once for each repository node of the project ? # 1 or 0 (default) # If true an additional parameter is sent to the # perl script (see below for its position) set ::NeedSources 0 # Should the violated rules definitions be generated? # true or false (default) # This creates a ruleset file with rules that are not already # part of your analysis model so you can review it and add # the rules manually if needed. set generateRulesDefinitions false # Should the File paths be case-insensitive? # true or false (default) # This is used when searching for a matching artefact in already-existing artefacts. set PathsAreCaseInsensitive false # Should file artefacts declared in the input CSV file be created automatically? # true (default) or false set CreateMissingFile true # Ignore findings for artefacts that are not part of the project (orphan findings) # When set to 0, the findings are imported and attached to the APPLICATION node instead of the real artefact # When set to 1, the findings are not imported at all # (default: 0)

set IgnoreIfArtefactNotFound 0

```
# For findings of a type that is not in your ruleset, set a default rule ID.
# The value for this parameter must be a valid rule ID from your analysis model.
# (default: empty)
set UnknownRuleId UNKNOWN_RULE
# Save the total count of orphan findings as a metric at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanArteCountId NB_ORPHANS
# Save the total count of unknown rules as a metric at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanRulesCountId NB_UNKNOWN_RULES
# Save the list of unknown rule IDs as textual information at application level
# Specify the ID of the metric to use in your analysys model
# to store the information
# (default: empty)
set OrphanRulesListId UNKNOWN_RULES_INFO
# The tool version to specify in the generated rules definitions
# The default value is "
# Note that the toolName is the name of the folder you created
# for your custom Data Provider
set ToolVersion ""
# FileOrganisation defines the layout of the CSV file that is produced by your
perl script:
     header::column: values are referenced from the column header
#
#
     header::line: NOT AVAILABLE
     alternate::line: NOT AVAILABLE
#
     alternate::column: NOT AVAILABLE
#
set FileOrganisation header::column
# In order to attach a finding to an artefact of type FILE:
    - Tool (optional) if present it overrides the name of the tool providing the
finding
   - Path has to be the path of the file
#
    - Type has to be set to FILE
   - Line can be either empty or the line in the file where the finding is
#
located
   Rule is the rule identifier, can be used as is or translated using Rule2Key
#
#
   Descr is the description message, which can be empty
 In order to attach a finding to an artefact of type FUNCTION:
#
   - Tool (optional) if present it overrides the name of the tool providing the
finding
   - Path has to be the path of the file containing the function
    - Type has to be FUNCTION
    - If line is an integer, the system will try to find an artefact function
  at the given line of the file
#
    - If no Line or Line is not an integer, Name is used to find an artefact in
   the given file having name and signature as found in this column.
# (Line and Name are optional columns)
```

```
# Rule2Key contains a case-sensitive list of paired rule IDs:
#
     {RuleID KeyName}
# where:
   - RuleID is the id of the rule as defined in your analysis model
#
#
   - KeyName is the rule ID as written by your perl script in the produced CSV
file
# Note: Rules that are not mapped keep their original name. The list of unmapped
rules is in the log file generated by your Data Provider.
set Rule2Key {
 { ExtractedRuleID_1 MappedRuleId_1
 { ExtractedRuleID_2 MappedRuleId_2 }
_____
= CSV File Format =
_____
According to the options defined earlier in config.tcl, a valid csv file would
be:
Path;Type;Line;Name;Rule;Descr
/src/project/module1/f1.c;FILE;12;;R1;Rule R1 is violated because variable v1
/src/project/module1/f1.c;FUNCTION;202;;R4;Rule R4 is violated because function
f1
/src/project/module2/f2.c;FUNCTION;42;;R1;Rule R1 is violated because variable v2
/src/project/module2/f2.c;FUNCTION;;skip_line(int);R1;Rule R1 is violated because
variable v2
Working With Paths:
_____
- Path seperators are unified: you do not need to worry about handling
differences between Windows and Linux
 With the option PathsAreCaseInsensitive, case is ignored when searching for
files in the Squore internal data
· Paths known by Squore are relative paths starting at the root of what was
specified in the repository connector durign the analysis. This relative path is
 the one used to match with a path in a csv file.
Here is a valid example of file matching:
 1. You provide C:\A\B\C\D as the root folder in a repository connector
 2. C:\A\B\C\D contains E\e.c then Squore will know E/e.c as a file
 3. You provide a csv file produced on linux and containing
    /tmp/X/Y/E/e.c as path, then Squore will be able to match it with the known
 file.
Squore uses the longest possible match.
In case of conflict, no file is found and a message is sent to the log.
_____
= Perl Script =
_____
The perl scipt will receive as arguments:
- all parameters defined in form.xml (as -${key} $value)
```

- the input directory to process (only if ::NeedSources is set to 1) - the location of the output directory where temporary files can be generated - the full path of the findings csv file to be generated For the form.xml and config.tcl we created earlier in this document, the command line will be: perl <configuration_folder>/tools/CustomDP/CustomDP.pl -csv /path/to/csv param MyValue <output_folder> <output_folder>/CustomDP.fdg.csv <output_folder>/ CustomDP.fdg.csv Example of perl script: _____ #!/usr/bin/perl use strict; use warnings; \$|=1 ; (\$csvKey, \$csvValue, \$paramKey, \$paramValue, \$output_folder, \$output_csv) = @ARGV; # Parse input CSV file # ... # Write results to CSV open(CSVFILE, ">" . \${output_csv}) || die "perl: can not write: \$!\n"; binmode(CSVFILE, ":utf8"); print CSVFILE "Path;Type;Line;Name;Rule;Descr"; print CSVFILE "/src/project/module1/f1.c;FILE;12;;R1;Rule R1 is violated because variable v1"; close CSVFILE; exit 0; _____ = ExcelMetrics = _____ The ExcelMetrics framework is used to extract information from one or more Microsoft Excel files (.xls or .xslx). A detailed configuration file allows defining how the Excel document should be read and what information should be extracted. This framework allows importing metrics, findings and textual information to existing artefacts or artefacts that will be created by the Data Provider. ================ = form.xml = You can customise form.xml to either: specify the path to a single Excel file to import - specify a pattern to import all Excel files matching this pattern in a directory In order to import a single Excel file: <?xml version="1.0" encoding="UTF-8"?> <tags baseName="ExcelMetrics" needSources="false"> <tag type="text" key="excel" defaultValue="/path/to/mydata.xslx" />

241

```
</tags>
Notes:
- The excel key is mandatory.
In order to import all files matching a patter in a folder:
<?xml version="1.0" encoding="UTF-8"?>
<tags baseName="ExcelMetrics" needSources="false">
 <!-- Root directory containing Excel files to import-->
 <tag type="text" key="dir" defaultValue="/path/to/mydata" />
 <!-- Pattern that needs to be matched by a file name in order to import it-->
 <tag type="text" key="ext" defaultValue="*.xlsx" />
 <!-- search for files in sub-folders -->
 <tag type="booleanChoice" defaultValue="true" key="sub" />
</tags>
Notes:
- The dir and ext keys are mandatory
- The sub key is optional (and its value set to false if not specified)
_____
= config.tcl =
_____
Sample config.tcl file:
_____
# The separator to be used in the generated csv file
# Usually \t or ; or ,
set Separator ";"
# The delimiter used in the input CSV file
# This is normally left empty, except when you know that some of the values in
the CSV file
# contain the separator itself, for example:
# "A text containing ; the separator"; no problem; end
# In this case, you need to set the delimiter to \" in order for the data
provider to find 3 values instead of 4.
# To include the delimiter itself in a value, you need to escape it by
duplicating it, for example:
# "A text containing "" the delimiter"; no problemo; end
# Default: none
set Delimiter \"
# The path separator in an artefact's path
# in the generated CSV file.
set ArtefactPathSeparator "/"
# Ignore findings for artefacts that are not part of the project (orphan
findings)
# When set to 1, the findings are ignored
# When set to 0, the findings are imported and attached to the APPLICATION node
# (default: 1)
set IgnoreIfArtefactNotFound 1
# For findings of a type that is not in your ruleset, set a default rule ID.
# The value for this parameter must be a valid rule ID from your analysys model.
```

(default: empty) set UnknownRuleId UNKNOWN_RULE # Save the total count of orphan findings as a metric at application level # Specify the ID of the metric to use in your analysys model # to store the information # (default: empty) set OrphanArteCountId NB_ORPHANS # Save the total count of unknown rules as a metric at application level # Specify the ID of the metric to use in your analysys model # to store the information # (default: empty) set OrphanRulesCountId NB_UNKNOWN_RULES # Save the list of unknown rule IDs as textual information at application level # Specify the ID of the metric to use in your analysys model # to store the information # (default: empty) set OrphanRulesListId UNKNOWN_RULES_INFO # The list of the Excel sheets to read, each sheet has the number of the first line to read # A Perl regexp pattern can be used instead of the name of the sheet (the first sheet matching # the pattern will be considered) set Sheets {{Baselines 5} {ChangeNotes 5}} # # COMMON DEFINITIONS # # - <value> is a list of column specifications whose values will be concatened. When no column name is present, the text is taken as it appears. Optional sheet name can be added (with ! char to separate from the column name) # Examples: - {C:} the value will be the value in column C on the current row # - {C: B:} the value will be the concatenation of values found in # column C and B of the current row - {Deliveries} the value will be Deliveries # - $\{BJ: " - " BL:\}$ the value will be the concatenation of value found in column BJ, # string " - " and the value found in column BL fo the current row # - {OtherSheet!C:} the value will be the value in column C from the sheet OtherSheet on the current row # - <condition> is a list of conditions. An empty condition is always true. A # condition is a column name followed by colon, optionally followed by a perl regexp. Optional sheet name can be added (with ! char to separate from the column name) Examples: # - $\{B:\}$ the value in column B must be empty on the current row # # - $\{B:.+\}$ the value in column B can not be empty on the current row # - $\{B:R_.+\}$ the value in column B is a word starting by R_ on the current row - {A: B:.+ C:R_.+} the value in column A must be empty and the value in # column B must contain something and the column C contains a word starting with ${\tt R}_{_}$ on the current row

Version : 18.0.18 Date : 27/09/2019

```
- {OtherSheet!B:.+} the value in column B from sheet OtherSheet on the
current row can not be empty.
# ##############
# # ARTEFACTS #
# ##############
# The variable is a list of artefact hierarchy specification:
# {ArtefactHierarchySpec1 ArtefactHierarchySpec2 ... ArtefactHierarchySpecN}
# where each ArtefactHierarchySpecx is a list of ArtefactSpec
# An ArtefactSpec is a list of items, each item being:
 {<(sheetName!)?artefactType> <conditions> <name> <parentType>? <parentName>?}
#
# where:
     - <(sheetName!)?artefactType>: allows specifying the type. Optional
sheetName can be added (with ! char to separate from the type) to limit
                                   the artefact search in one specific sheet.
When Sheets are given with regexp, the same regexp has to be used
#
                                   for the sheetName.
#
                                   If the type is followed by a question mark
 (?), this level of artefact is optional.
                                   If the type is followed by a plus char (+),
this level is repeatable on the next row
     - <condition>: see COMMON DEFINITIONS
     - <value>: the name of the artefact to build, see COMMON DEFINITIONS
#
  - <parentType>: This element is optional. When present, it means that the
#
current element will be attached to a parent having this type
  - <parentValue>: This is a list like <value> to build the name of the
artefact of type <parentType>. If such artefact is not found,
                   the current artefact does not match
# Note: to add metrics at application level, specify an APPLICATION artefact
which will match only one line:
       e.g. {APPLICATION {A:.+} {}} will recognize as application the line
having column A not empty.

Appendix C. Milestones Tutorial

With the introduction milestones in your project, Squore offers new ways to measure your objectives and detect deviations from your goals early. Milestones are a series of goals for specific metrics at certain dates in the life of your project and add the following to your process management:

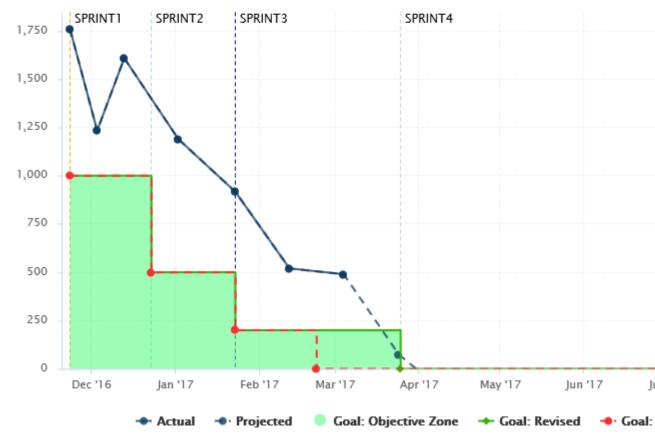

- You are alerted early if your current performance shows that you will not meet your goals and can react before it is too late
- ightarrow You keep track of your various goals and communicate any change to the rest of your team
- → You can reflect on a project's history and learn from it

This example focuses on a project that is slipping, and shows how the team reacts along the course of the development process. Our team is tracking several objectives around issue management, technical debt and self-descriptiveness over the lifetime of the project, which includes milestones for 5 sprints labelled SPRINT1 to SPRINT5.

Here is where they stand in the fourth sprint and try to assess whether they will meet their Technical Debt objective for the release date at the end of Sprint 5:

Chart: Technical Debt Objective Plan

- Project: Sun, Artefact: Sun

The chart shows the following information:

Squore is protected by an Interdeposit Certification registered with Agence pour la Protection des Programmes under the Inter Deposit Digital Number IDDN.FR.001.390035.001.S.P.2013.000.10600. 279

Version : 18.0.18 Date : 27/09/2019

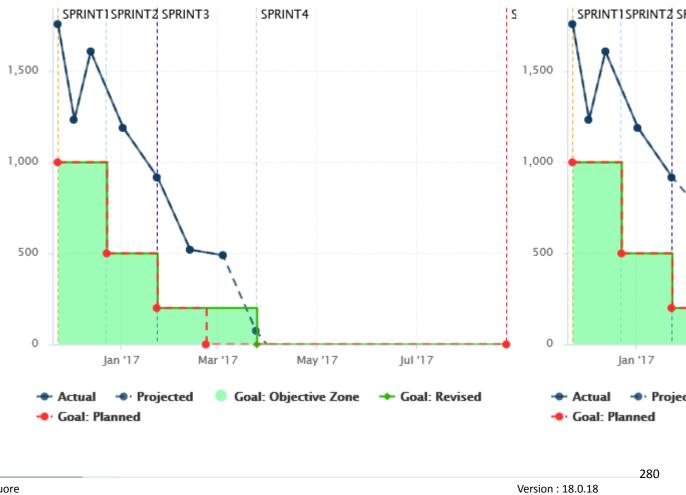

- → Vertical dotted lines (markers) on the x-axis for each milestone in the project at the predefined date
- → A solid dark-blue line showing the technical debt value for each version of the project so far
- A dotted dark-blue line showing estimations for technical debt for future versions absed on the progress so far
- A dotted red line showing the goals set at the beginning of the project for each sprint for the technical debt metric
- → A solid green line showing the goals as they were revised as time went on (the date for Sprint 4 was moved back).
- A turquoise area highlighting the acceptable range for the tehnical debt for each sprint, making it clear that the technical debt has never been under control so far, but that projections show that the goal should be met by the end of Sprint 3

In order to understand why changes were made to the goals, let's go back to V4 and look at the Technical Debt Objective Plan again. The end of Sprint4 still has its original date, and projections aready show that technical debt will not be under control by the end of the sprint.

Our chart is configured to show the projected value for the next 5 analyses (based on the rate of previous analyses), and the firth projection meeting the expectations for SPRINT4 appear well after the original date for SPRINT4.

Chart: Technical Debt Objective Plan @

Project: Sun, Artefact: Sun

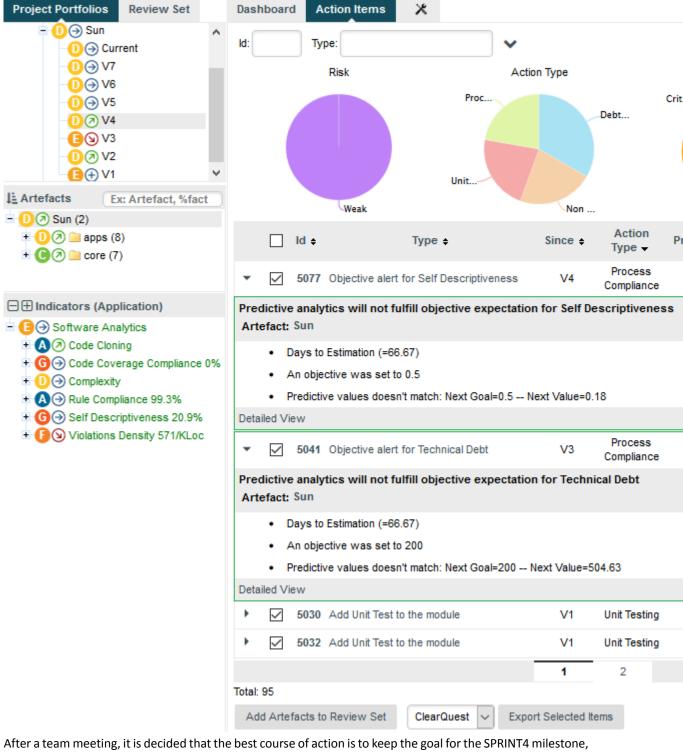

Date: 27/09/2019

Ref : SUM_Squore

https://www.squoring.com/

Getting Started Guide

The team knew this at the time: a **Objective alert for Technical Debt** action item was opened on as early as V3 to inform them that the current performance could cause problems for their objective set 50 days later.

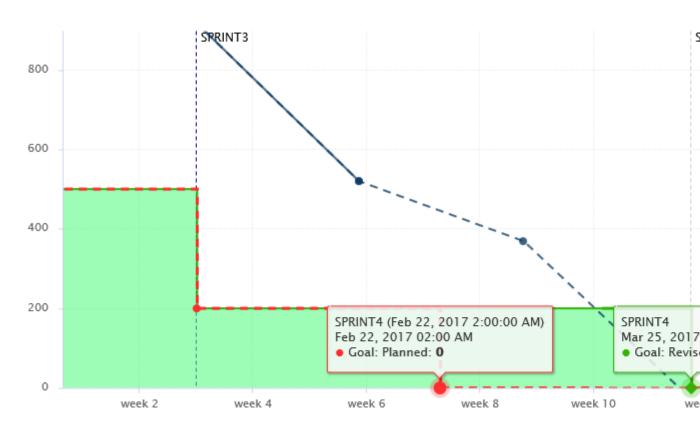

but move its date back by one month. The next analysis confirms this on the Technical Debt Objective plan chart, where you see the first deviation between the planned goal (red) and the actual goal (green). The progress objective will be now met:

281

https://www.squoring.com/

Getting Started Guide

How it works

In order to add support for milestones to your model, configure your wizard to allow users to create milestones and goals:

```
<Bundle xmlns:xi="http://www.w3.org/2001/XInclude">
  <wizard wizardId="ANALYTICS" versionPattern="v#N1#" img="../../Shared/Wizards/
squore_logo.png" hideRulesEdition="FALSE">
  <milestones canCreateMilesEdition="FALSE">
  <goals displayableFamilies="ANALYTICS_GOALS" />
  </milestones>
  </wizard>
</Bundle>
```

The **milestones** element allows users to create milestones in the project wizard (canCreateMilestone="TRUE") and also set goals (canCreateGoal="TRUE"). The goals can be set for metrics of the GOALS family only in this example (displayableFamilies="ANALYTICS_GOALS").

The result in the web UI is the following:

282

https://www.squoring.com/

| | ers Rules Edition Confirmati | | |

| | | | Cano |

Getting Started Guide

When creating a new project, a user decides to create a **Sprint 1** milestone with one objective of **500** for the **Technical Debt** indicator. Other goals can be set, for the other metrics in the project that belong to the **ANALYTICS_GOALS** family listed in the dropdown list at the bottom of the table.

If you have company-wide milestones and objectives that need to be set for every project created with the wizard, you can specify the goals directly. Milestones can also be marked as mandatory or optional:

```
<Bundle xmlns:xi="http://www.w3.org/2001/XInclude">
 <wizard wizardId="ANALYTICS_WITH_MILESTONES" versionPattern="v#N1#" img="../../</pre>
Shared/Wizards/squore_logo.png" hideRulesEdition="FALSE">
  <milestones canCreateMilestone="TRUE" canCreateGoal="TRUE">
   <goals displayableFamilies="GOALS">
    <goal measureId="TECH_DEBT" mandatory="TRUE" highestIsBest="FALSE" />
    <goal measureId="ISSUE_BLOCKER" mandatory="TRUE" highestIsBest="TRUE" />
    <goal measureId="ISSUE_CRITICAL" mandatory="TRUE" highestIsBest="TRUE" />
    <goal measureId="ROKR_SUBSET" mandatory="TRUE" highestIsBest="FALSE" />
   </goals>
   <milestone id="REQUIREMENT_FREEZE" mandatory="TRUE">
    <defaultGoal measureId="TECH_DEBT" value="0" />
    <defaultGoal measureId="ISSUE_BLOCKER" value="1"</pre>
    <defaultGoal measureId="ISSUE_CRITICAL" value="30"</pre>
                                                        />
    <defaultGoal measureId="ROKR_SUBSET" value="1" />
   </milestone>
   <milestone id="INFRASTRUCTURE_FREEZE" mandatory="TRUE">
    <defaultGoal measureId="TECH_DEBT" value="0" />
    <defaultGoal measureId="ISSUE_BLOCKER" value="1" />
    <defaultGoal measureId="ISSUE_CRITICAL" value="50" />
    <defaultGoal measureId="ROKR_SUBSET" value="1" />
   </milestone>
   <milestone id="CODE_FREEZE" mandatory="TRUE">
    <defaultGoal measureId="TECH_DEBT" value="0" />
    <defaultGoal measureId="ISSUE_BLOCKER" value="1" />
    <defaultGoal measureId="ISSUE_CRITICAL" value="90" />
    <defaultGoal measureId="ROKR_SUBSET" value="0.5" />
   </milestone>
   <milestone id="BETA_RELEASE" mandatory="FALSE">
    <defaultGoal measureId="TECH_DEBT" value="1" />
    <defaultGoal measureId="ISSUE_BLOCKER" value="1" />
    <defaultGoal measureId="ISSUE_CRITICAL" value="95" />
    <defaultGoal measureId="ROKR_SUBSET" value="0.3" />
   </milestone>
   <milestone id="RELEASE" mandatory="TRUE">
    <defaultGoal measureId="TECH_DEBT" value="1" />
    <defaultGoal measureId="ISSUE_BLOCKER" value="1"</pre>
                                                      />
    <defaultGoal measureId="ISSUE_CRITICAL" value="100" />
    <defaultGoal measureId="ROKR_SUBSET" value="0" />
   </milestone>
  </milestones>
 </wizard>
</Bundle>
```

When creating a new project, the predefined goals are filled in in the web interface, and you can still add a **Beta Release** milestone (using the default values specified in the wizard bundle) if needed by using the + icon:

| ect Identification | | | | | |
|---|--|-------------------------------------|---------------|-----------|------|

A project wizard with preconfigured milestones and goals

If you create projects using the command line interface, you can specify settings for your milestones with the -M parameter:

```
-M "id=BETA_RELEASE,date=2017/05/31,ISSUE_CRITICAL=95"
```

or with a project config file:

```
<SquoreProjectSettings>
<Wizard>
<Milestones>
<Goal id="BETA_RELEASE" date="2017-05-31">
<Goal id="ISSUE_CRITICAL" value="95" />
</Milestone>
</Wilestones>
</Wizard>
</SquoreProjectSettings>
```

In your analysis model, new functions are available to work with milestones and projections:

HAS_MILESTONE([mileston@hdecks if a milestone with the specified milestoneld exists in the project. The or keyword] [, date]) function returns 0 if no milestone is found, 1 if a milestone is found. Find if we are at the last milestone of the project:

| | <pre>IS_LAST_MILESTONE=IF(HAS_MILESTONE(),0,1)</pre> |
|---|---|
| DATE_MILESTONE([milesto or keyword] [, date]) | Reld irns the date associated to a milestone. Find if the date for the milestone BETA_RELEASE has been modified between June 2015 and now: |
| | DATE_HAS_SLIPPED=(DATE_MILESTONE(BETA_RELEASE)- DATE_MILESTONE(BETA_RELEASE, DATE(2015,06,01))) != 0 |
| | Compute the date difference between the previous and next milestones: |
| | MILESTONE_DURATION=DATE_MILESTONE(NEXT) - DATE_MILESTONE(PREVIOUS) |
| | Find the date slip for the next milestone between now and the previous anlaysis: |
| | DATE_SLIP=DATE_MILESTONE(NEXT) - DATE_MILESTONE(NEXT, VERSION_DATE(PREVIOUS)) |
| | Find the amount of time left until the next milestone: |
| | DEADLINE=DATE_MILESTONE(NEXT) - VERSION_DATE() |
| GOAL(measureld [, milestoneld or keyword] [, date]) | Returns the goal for a metric at the specified milestone. Find the goal for requirement stability set for the milestone PROTOTYPE as of June 2016: |
| | REQ_STABILITY_GOAL=GOAL(REQ_STABILITY, PROTOTYPE, DATE(2016,06,01)) |
| | Find the delta between the goal for TEST between the previous and next milestones: |
| | DELTA=GOAL(TEST) - GOAL(TEST, PREVIOUS) |
| | Find the delta between the goal for TEST for the next milestone set for the previous analysis and now: |
| | DELTA=GOAL(TEST) - GOAL(TEST, NEXT, VERSION_DATE(PREVIOUS)) |
| | Find the delta between the current value of TEST and the goal for TEST at the next milestone: |
| | DELTA=GOAL(TEST) - TEST |

Tip

You can use keywords instead of using a milestone ID. You can retrieve information about the next, previous, first or last milestones in the project by using:

- \rightarrow NEXT
- \rightarrow **NEXT+STEP** where STEP is a number indicating how many milestones to jump ahead
- → PREVIOUS
- → **PREVIOUS-STEP** where STEP is a number indicating how many milestones to jump backward
- \rightarrow FIRST
- \rightarrow LAST

Consut the Configuration Guide for more details.

Ref : SUM_Squore

On your charts, you are now able to:

- → Display the goals defined for each milestone in your project
- Display the changes made to the goals defined for each milestone
- → Display the date changes for your milestones
- → Show markers for milestone dates and goals

You can also compute metrics with functions like **LEAST_SQUARE_FIT()**, which lets you calculate projections. This is how the Task Completion chart used in this example was created. You can find its full definition below:

```
<chart id="OBJECTIVE_TECH_DEBT" type="TE" byTime="true" dateFormat="MM/yy"
yMin="0" displayOnlyIf="HAD_GOAL_TECH_DEBT">
<dataset renderer="LINE">
 <measure dataBounds="[0;[" color="#0B3861" stroke="SOLID" shape="CIRCLE"</pre>
alpha="200" label="Actual">TECH_DEBT</measure>
 <measure color="#0B3861" stroke="DOTTED" shape="CIRCLE" alpha="200"</pre>
label="Projected">TECH_DEBT
  <forecast>
   <estimatedVersion timeValue="CUR_BUILD_DATE+1*DELTA_MEAN"/>
   <estimatedVersion timeValue="CUR_BUILD_DATE+2*DELTA_MEAN"/>
   <estimatedVersion timeValue="CUR BUILD DATE+3*DELTA MEAN"/>
   <estimatedVersion timeValue="CUR_BUILD_DATE+4*DELTA_MEAN"/>
   <estimatedVersion timeValue="CUR_BUILD_DATE+5*DELTA_MEAN"/>
  </forecast>
  </measure>
</dataset>
<dataset renderer="AREA_STEP">
 <goal dataBounds="[0;[" color="88,250,130" stroke="SOLID" shape="DIAMOND"</pre>
alpha="150" label="Objective Zone">TECH_DEBT</goal>
</dataset>
<dataset renderer="STEP">
 <goal dataBounds="[0;[" color="#31B404" stroke="SOLID" shape="DIAMOND"</pre>
alpha="255" label="Revised">TECH_DEBT</goal>
 <goal dataBounds="[0;[" color="#FE2E2E" stroke="DOTTED" shape="CIRCLE"</pre>
alpha="255" label="Planned" versionDate="FIRST_BUILD_DATE">TECH_DEBT</goal>
</dataset>
<markers>
 <marker alpha="150" color="189,189" isVertical="false" endValue="0"/>
 <marker fromMilestones="true" alpha="150" isVertical="true" stroke="DOTTED" />
</markers>
</chart>
```

The action items monitoring the project's progress also make use of the new **GOAL()** function and were defined as follows:

287

https://www.squoring.com/

```
<Trigger>

<Test expr="GOAL_ESTIMATED_TECH_DEBT-ESTIMATED_TECH_DEBT" bounds="];0["

descrId="GOAL_WILL_NOT_BE_REACHED" p0="#{MEASURE.GOAL_ESTIMATED_TECH_DEBT}"

p1="#{MEASURE.ESTIMATED_TECH_DEBT}" />

<Test expr="GOAL_TECH_DEBT" bounds="[1;1]" descrId="GOAL_IS_ACTIVATED"

p0="#{MEASURE.GOAL_ESTIMATED_TECH_DEBT}" />

<Test expr="DAY_TO_ESTIMATION" bounds="];[" descrId="DAY_TO_ESTIMATION"

p0="#{MEASURE.DAY_TO_ESTIMATION}" />

</Trigger>

</DecisionCriterion>

</DecisionCriteria>

</Bundle>
```

Check out the Getting Started Guide and the Configuration Guide to learn everything about milestones in Squore.

Symbols

*** What's New in Squore 18.0?

A new CSV format for importing information into Squore is available in the csv_import Data Provider framework, 217

A sample implementation of a Data Provider now allows to import XML directly into Squore, 217

Built-in support for ticket and test artefacts in Software Analytics, 115

Charts react to the current filter in the Explorer, 43 Create and share new highlight categories with other Squore users, 63

Create data providers in your own language that generate data in more than one step, 211

Create highlight categories directly from the web interface, 58

Create support for new languages in Squan Sources to create artefacts in your project, 201

Debug package now includes data for all relevant previous versions to investigate a problem, 4

Display the results of the current filter as a highlight category, 59

Extra filtering options for findings allow showing or hiding findings relaxed in source code., 91

Extra filtering options for findings allow showing or hiding suspicious findings., 94

Findings markers in the source code viewer now reflect the relaxation state of the finding, 91

Full revamp of the filter dialog: Save and share filters that apply to the entire Explorer, 41, 50

Hybrid SVN mode saves you an extra checkout of your source tree, 165

Improved cloning detection tool now allows ignoring comments and blank lines and setting a minimum size for duplicated blocks, 184

- Improved code stability computation allows tracking findings when artefacts have moved, 184 JUnit Data Provider produces test artefacts and links instead of findings, 177
- New Data Provider: CPU Data Import, 192

New Data Provider: ESLint, 174

New Data Provider: Jira, 196

New Data Provider: JSHint, 177

New Data Provider: Mantis, 197

New Data Provider: Memory Data Import, 193

New Data Provider: MSTest, 179

New Data Provider: SonarQube, 201

New Data Provider: Stack Data Import, 193

New Data Provider: Ticket Data Import, 194 New Repository Connector: GNAThub, 165 RestoreContext supports passing only a versionId parameter to load a project's dashboard, 140

RTRT can now create test artefacts in your project tree, 183

Save your filters from the Explorer in the new Filter Panel, 43, 50

Set multiple filtering criteria based on indicators, metrics and textual information in the new Filter Panel, 50

Squore now highlights relaxed findings that should be reviewed again because of source code changes., 91

VectorCAST can now create test artefacts in your project tree, 189

When filtering artefacts, their parents are greyed out if they do not match the filter, 43

XML Schema published for form.xml , 207

XML Schema published for input-data.xml , 212 You can use a required tag of type booleanchoice to ensure that users must check a box in the web UI or set the parameter to true when building from the command line in order to proceed with the analysis., 209

* Deprecated Functionality

The Data Provider frameworks available in previous versions of Squore are still available and supported, however new Data Provider frameworks have been introduced and should be considered when creating new Data Providers, 217
